

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

## P R Æ F A T I O.

**I**NTER THEORIAM ÆQUATIONUM ALGEBRAÏCARUM atque FLUXIONALIUM tanta intercedit Analogia, eadēque tam arctā affinitate, imò cognatione, inter sese consociantur et conjunguntur; ut absque hujus ope, illa jure imperfecta, et quasi manca, existimari debeat: Nam per calculum FLUXIONALEM, seu, ut ab exteris designatur, DIFFERENTIALEM, (vix nisi nomine et notatione à se invicē discrepantes) optimè promovendā est ALGEBRA. Sicut unico patere poterit exemplo, THEOREMATIS BINOMII, quod, licet indies ejus sit omninò fluxionalis, omnes tamen MATHESIOS regiones permeat et adauget. Hanc igitur ANALYSIN FLUXIONUM, ANALYSI ÆQUATIONUM pridem editā (\*), planè gemellam, edere jam libet; ut pro virili fungar munere interpretis fidi ANALYSEOS ANTIQUÆ illius, veræ et genuinæ:—"Quæ cum *Algebræ Speciosâ* facilitate contendit, evidentia verò et demonstrationum elegantiâ eam longè superare videtur;"—Teste, peritissimo *Geometrà simul ac Analystâ*, EDMUNDO HALLEY; qualem eam optimè exponit PAPPUS ALEXANDRINUS (in APPENDICE, l. § 136.) ex scriptis Veterum *Analystarum*:—ARCHIMEDIS, in *Quadraturâ Parabolæ*; APOLLONII, in tractatu de *Sectione Rationis*; EUCLIDIS, in *Libris Datorum et Porismatum*; ERATOSTHENIS, de *Mediis Proportionalibus*, &c.—Hanc verò ANALYSIN ANTIQUAM pænè amissam; (CARTESIO, ejusque sectatoribus, haud minùs MATHESIN quàm PHILOSOPHIAM inquinantibus, adhibendo demonstrationes, antiquis quidem breviores;

(\*) *Tractatum priorem (ANALYSIN ÆQUATIONUM) impensis propriis edidi anno 1784; hunc verò, pro singulari suo, in MATHESIN, PHILOSOPHIAMQUE BRITANNICAM studio, impensis suis editurus est vir cl. FR. MASERES, vel ipso flagitante. Neque, ut soero, in amici dignissimi modestiam peccasse censebor, si in lucem, (etiam illo invito), excerpta quædam deprompserim ex epistolâ ejus, hanc rem spectantia; Sept. 17. anno 1799 datâ:*

—"I am glad to find that you have been so actively and usefully employed, since your return to IRELAND, as in revising and enlarging your *Analysis Fluxionum*; which I hope you will soon publish. If you will send it to me, I will print it for you, either in the *Fifth* Volume of the *Scriptores Logarithmici*, or by itself;—or half the number of copies in the *Scriptores Logarithmici*, and the other half by themselves, as you shall direct. And I believe that last manner of printing it would be the best:—that is, to print 250 copies in the *Scriptores Logarithmici*, and another 250 separately; as, by this way, it will come sooner into the hands of the Learned."

—"I wish you every opportunity of propagating your taste for sound literature and science; and thereby of becoming eminently useful to your COUNTRY: than which, nothing can afford you greater satisfaction."

See § 4, Note (\*); § 17, Note (d); and § 131.

at longè laxiores atque infirmiores) curiosâ felicitate restituit, et inflauavit et perfecit NEWTONUS, Veterum evidentiam et certitudinem, Recentiorum breuitatem et facilitatem, rarissimâ conjunctione affecutus; si modò rite expendatur et probè intelligatur imperatoria breuitas quâ METHODUM FLUXIONUM delibando transcurrit Inventor ille sagacissimus.

Huius Methodi fons et origo est Doctrina RATIONUM PRIMARUM ET ULTIMARUM; cuius ope demonstrantur LEMMATA illa præclara seu PRINCIPIA MATHEMATICA, perbreuia et subtilissima, in primâ sectione doctissimi et celeberrimi illius libri cui titulus, Philosophiæ Naturalis Principia Mathematica. Hæc verò Doctrina, qualem ipse auctor eam orbi litterato in diversis suis scriptis proposuit, pulcherrimam exhibet synopsis paritèr et extensionem METHODI EXHAUSTIONUM à veteribus geometris usurpatæ et excullæ, quam vir mirandâ sagacitate præditus uno eodémque tempore in compendium redegit et ad novas et maximè arduas speculationes felicissimè promouit et applicuit.

Cæterùm fatendum est hanc Doctrinam RATIONUM PRIMARUM ET ULTIMARUM, ex intimis METAPHYSICÆ fontibus haustam, et "quâ potuit breuitate" à NEWTONO traditam, obscuritate non faciliè discutiendâ involvi: quocircâ expositio ejusdem, satis lucida, evidens, et accurata (non obstantibus tot tantisque Interpretibus Analyseos Newtonianæ) hætenùs desiderari videtur; èstque conditio sine quâ non clarè cernere atque animo completi licebit fundamentum solidum et nullis cavillationibus dimouendum, cui adstruitur tota THEORIA FLUXIONUM, neque diluere objectiones doctorum quorundam virorum, qui etiàm his seris temporibus ejusdem evidentiam et certitudinem impugnant, siue ex incitiâ vel imperitiâ, vel denique ex inuidiâ et partium quodam studio, oriundas.

Itaque, ne falsis criminibus ulteriùs premi videatur Methodus Fluxionum, in PRIMA PARTE, ausus sum fontes ipsos METAPHYSICOS recludere ex quibus derivantur PRINCIPIA MATHEMATICA FLUXIONUM, in SECUNDA PARTE; Analyseos Antiquæ et veræ quasi custos rigidisque Satelles; et magni mirandique ANALYSTÆ BRITANNICI æquus et candidus vindex; excussis quàm fidelissimè et quàm accuratissimè potuerim, objectionibus Analystarum magni nominis, BERKELEY, LANDEN, D'ALEMBERT, TORELLI, DE LA GRANGE, &c. et nuperrimè, CENSORIS (ut ferunt, Professorii et Academici,) apud THE MONTHLY REVIEW, Appendix, April 1798, Vol. 28. N. S.

In hac Disquisitione, subtilissimâ sane et reconditissimâ, et inter laborem "tardè eruendi quæ tam altè jacent," Demonstrationem Theorematis Binomii, à doctissimo viro, Johanne Landen, inventam, (quam ego dudum admiratus fueram et in ANALYSI ÆQUATIONUM adhibueram et excolueram,)

eram,) iterum ad examen revocare visum est; et, cum ista demonstratio vix, et ne vix quidem, in principiis in quibus fundatur, à computo fluxionali discrepare videtur, aliam demonstrationem ejusdem Theorematis omnino, novam, et in principiis Methodi Fluxionum fundatam, huic Landenianæ substituendam esse judicavi; quæ quidem est ipsâ longè facilior, et simplicior, et ad naturam Theorematis demonstrandi magis accommodata, utpote quæ derivatur ex analogiâ quâdam elegantissimâ, quæ intercedere observatur inter SERIEM BINOMIAM, et SERIEM FLUXIONUM ORDINUM SUPERIORUM, quarum serierum termini correlativi sunt ad se invicem semper in datâ quâdam ratione.

HIS VINDICIIS NEWTONIANIS—METAPHYSICIS et MATHEMATICIS—in APPENDICE II. alias quoque—PHYSICAS et THEOLOGICAS—subungere visum est; ut laus debita illi PHILOSOPHO CHRISTIANO, integra servetur et illibata; quam inquinare non verentur, falsò atque ignavè, MINUTI quidam PHILOSOPHI, hoc “SÆCULO perperam sanè ab iis, eorumque sectatoribus, RATIONIS dicto. Pudètque inter hujusmodi obrectatores, inveniri ipsius NEWTONIANÆ PHILOSOPHIÆ (ad THEOLOGIAM sobriè et humiliter hætenus ancillantis,) non solùm Discipulùm sed etiàm Professore, ROBISON, apud EDINBURGENSES; temerè inculpantem theoriam illam sublimem at longè subtilissimam “De pulsibus medii ætherii, vibrando propagatis à corporibus tremulis ad sensorium usque; ibique, à substantiâ sensitivâ, seu vi sentiendi, intelligendi, et agendi perceptis:”—cujus objectiones penitiùs et fusiùs, ex NEWTONI scriptis, et testimoniis PHILOSOPHIÆ PRIMARIÆ et SACRÆ, antiquitus in honore habitæ, in hac secundâ Appendice excutiuntur.

Quàm cautè verò, et quàm timidè procedendum in luce sublustri Analyseos sublimioris,—NATURAM DIVINAM HUMANAMQUE explorantis, ideâsque claras et determinatas INFINITATIS arripere gestientis,—monet MACLAURIN optimus:

“In reasoning concerning *finite* quantities, we apprehend that GEOMETRICIANS cannot be too scrupulous in admitting or treating of *Infinities*; of which our ideas are *so very imperfect*.—PHILOSOPHY probably will always have its *mysteries*; but these are to be avoided in GEOMETRY (\*), and

(\*) GEOMETRY has its *mysteries*, no less than PHILOSOPHY and RELIGION: Witness the elementary doctrine of *Parallels*, resting on the disputed foundation of the *eleventh* axiom of *Euclid*, the intuitive evidence of which is denied by *Tacquet* and others; and the *quadrature of the circle*, which can only be solved by approximation, still remains the reproach of Geometricians. In ALGEBRA, the *irreducible case* of cubick equations exhibits two of the roots under an impossible form, when all are real: which, notwithstanding, can be accurately extracted in some particular cases; and in the rest approximately, by means of the *Binomial Theorem*. And in FLUXIONS, too, the famous *Problem of the Three Bodies*, so necessary to determine the accelerations or retardations of the motions of the planets and the derange-  
ments

and we ought to guard against abating from its strictness and evidence the rather, that *an absurd PHILOSOPHY is the natural product of a vitiated GEOMETRY.*"

KILLESANDRA,  
Oct. 23, 1799.

}

ments of their orbits, by their mutual attractions, (of which approximate solutions have been given by *Euler, Clairaut* and *D'Alembert*,) is thus represented by the first of these three great men, with all the candour of a profound Mathematician :—" *Hujus problematis enodatio completa omnes ANALYSEOS vires transcendere videtur.*"—The difficulty consists in integrating three differential equations of the second order ; or, in the language of Newton's doctrine of Fluxions, in finding the fluents of three fluxionary equations of the second order.—Indeed the whole theory of the *Resolution of the Higher Equations in Algebra*, and the *Inverse Method of Fluxions*, which corresponds thereto, is extremely imperfect still, in this OUR INFANCY OF SCIENCE.—See *Maclaurin's* dying words, *Appendix*, II. § 162.

# ANALYSIS FLUXIONUM.

---

## PARS PRIMA.

---

### DE FLUXIONUM INVENTIONE.

§ 1. *THEORIÆ Fluxionum* præstantia insignis, omnis *Matheseos* fines peragrans, promoventis et illustrantis, prorsus postulare videtur ut præmittantur aliqua, more historico, de ejus inventione; qualia extant in *Commercio Epistolico Johannis Collins* et aliorum, anno Domini 1712, edito, atque iterum auctius anno Domini 1722; in *Raphson's History of Fluxions*; in diversis editionibus *Principiorum Newtoni*; *Hutton's Mathematical Dictionary*; et *Monthly Review*, Append. Vol. 28, 1799.

2. Utrum *Newtono* an *Leibnitzio* tribuenda sit laus hujus inventionis, et uter horum eam prius meditando extuderat; diu atque acriter contestatum est inter fautores *calculi fluxionalis* et *calculi differentialis*, vix ab invicem nisi mera notatione discrepantium; et *ad hoc sub judice lis est*.

3. Veruntamen hanc controversiam penitus inspicienti, et sine partium studio perpendenti, satis constabit, utrumque horum illustrium Geometrarum pro ejusdem inventore jure censi posse; utrumque, præcellenti ingenio et mirâ sagacitate præditum, utrumque eodem "*labore improbo*," et "*cogitandi vi indefessâ*" functum, ex iisdem fontibus scientiæ utrique patentibus, tandem eadem *elementa metaphysica*, eadem *principia mathematica*, methodi sive *fluxionalis* sive *differentialis*, hausisse; atque sectatoribus suis delibasse, principio, carptim, ac sine demonstrationibus edita. Hæc quidem *Newtonus* postea, obiter tantum, et quasi invitatus, longo post tempore supplevit, parca et "*quæ potuit brevitate*," in *Lemmate Secundo Lib. II. Princip.*; in *Quadraturâ Curvarum*; et in *Analyfi per Æquationes numero terminorum infinitas*:—Hanc curam *Leibnitzius* (vir omnimodæ scientiæ avidus, et à Geometriæ studio nimis sæpe ad alias speculationes ingenii vires transfrens) prorsus neglexit, discipulisque suis celeberrimis, *Jacobo* et *Johanni Bernoulli*, eorumque successoribus *Euler*, *D'Alembert*, *La Grange*, et *La Place*, legavit; qui munus sibi demandatum, demonstrandi et in immensum promovendi fines fluxionum, longè ultra limites *Newtonianos* et *Leibnitzianos*, ingenti cum emolumento ipsius *MATHESIOS*, exsecuti sunt.

4. Glo-

4. Gloriabatur certè *Leibnitz*,—"se *Newtono* nil debuisse;" nec inficiabatur *Newtonus*: pro suâ modestiâ inexpugnabili nihil sibi arrogans, et tantum postulans *jus æquum partitionis*, patiens et commodus; "cui omnium mortalium minimè necessarium fuit "*laudem aliunde mutuari*:"—*Hanc sibi ipsi peperit*," (a). Audiamus ipsum, in *primâ editione PRINCIPIORUM*, anno 1687, p. 253. de *Fluxionum inventione* differentem:

"In literis quæ MIHI cum Geometrà peritissimo GULIELMO, GOTHOFREDO, LEIBNITIO annis abhinc decem [1677] intercedebant, cum significarem me compotem esse methodi determinandi Maximas et Minimas, ducendi Tangentes, et similia peragendi; quæ in terminis surdis æquè ac in rationalibus procederet; et literis transpositis hanc sententiam continentibus—"Datâ æquatione, quocunque fluentes quantitates involvente, fluxiones invenire"—eandem eclarem: rescripsit vir clarissimus "se quoque in ejusmodi methodum incidisse;" et methodum suam communicavit, à meâ vix abundentem, præterquam in verborum et notarum formulis," ["et ideâ generationis quantitatum"—inseruntur hæc quatuor verba in editione secundâ *PRINCIPIORUM* anno 1713]—"Utriusque fundamentum continetur in hoc lemmate." [II. Lib. II. *PRINCIP.*]

5. Et certè fatendum est, semina non obscura *methodi sue differentialis*, possuisse *Leibnitzi*um, in *Theoriâ Notionum Abstractarum*, *Academiæ Regiæ Parisiensis* dicatâ, anno 1671; antequam cum *Newtono* commercium aliquod epistolicum instituisset. Hanc methodum postea publici juris fecit, in epistolâ quâdam in *Actis Lips.* Jan. 21, 1677, editâ, verum absque demonstratione prolatam; quam postea suppleverunt, celeberrimi fratres, *Daniel et Johannes Bernoulli*; famæ *Leibnitzi*anæ vindices acerrimi, iisdemque fontibus analyticos sublimioris haud levitèr imbuti.

(a) Dr. Halley, in his letter to Mr. *Newton*, dated May 22, 1686, informing him that the *Royal Society* had resolved to print his "*Incomparable Treatise* intitled *PHILOSOPHIÆ NATURALIS PRINCIPIA MATHEMATICA*," at their own charge, in a large quarto of a fair letter—"judging that so excellent a work ought not to have its publication delayed"—concludes with stating Mr. *Hook*'s claim—"as having some pretensions upon the invention of the rule of gravity being reciprocally as the squares of the distances from the centre. He says you had the notion from him, though he owns the demonstration of the *curvus* generated thereby to be wholly your own.—How much of this is so, you know best; as likewise, what you have to do in this matter. Only Mr. *Hook* seems to expect you should make some mention of him in the Preface, which it is possible you may see reason to prefix."

"I must beg your pardon that it is I that send you this ungrateful account; but I thought it my duty to let you know it, that so you might act accordingly: being in myself fully satisfied, that the greatest candour imaginable is to be expected from a person who has of all men the least need to borrow reputation."

See the whole letter, and the proceedings of the *Royal Society* on this business, in *Birch's History of the Royal Society*, Vol. IV. p. 484.

In consequence of this unfounded claim of Dr. *Hook*, and his own aversion to controversy, *Newton* withdrew the third book of the *Principia*, which treated of the *System of the World* in a popular way; wishing not to let it go abroad into the world, without a strict and rigorous demonstration; as it appeared afterwards:—

"De hoc argumento composueram librum tertium [DE MUNDI SYSTEMATE] methodo populari, ut à pluribus lgeretur. Sed quibus principia posita satis intellecta non fuerint, ii vim consequentiarum minimè percipient, neque præjudicia deponent, quibus à multis retrò annis insueverunt: Et propterea, ne res in disputationes trahatur, summam libri illius transuli in Propositiones, more mathematico, ut ab his solis legantur qui principia prius eolverint."

Præfat. in Lib. III. *Princip.*

6. Nec extant testimonia, *Newtonum* methodum suam fluxionum cuivis communicasse ante annum 1672; regeat enim *Newtonus*, in brevi illâ historiâ de fluxionum inventionem, *Schol. Lem. II. Lib. II. Princip. 3tiæ edit. 1726, p. 245*, in his verbis.

“In epistolâ quâdam ad *D. Collinsum* nostratem 10 Decemb. 1672 datâ, cum descripsissem *methodum Tangentium* quam suspicabar eandem esse cum *methodo Slusii* (tum nondum communicatâ), subjunxi:”

—“*Hoc est unum particulare, vel COROLLARIUM potius, METHODI GENERALIS quæ extendit se citrà molestum ullum calculum, non modò ad DUCENDAS TANGENTES ad quasvis curvas, sive geometricas sive mechanicas; vel quomodocumque rectas lineas, aliasve curvas, respicientes; verùm etiã ad resolvendum alia abstrusiora problematum genera DE CURVITATIBUS, AREIS, LONGITUDINIBUS, CENTRIS GRAVITATIS CURVARUM, &c. Neque (quemadmodum HUDDENII methodus de MAXIMIS ET MINIMIS) ad solas restringitur æquationes quæ quantitativis sordis sunt immunes. HANC METHODUM intertuli alteri isti [DE ANAL. SI PER ÆQUATIONES NUMERO TERMINORUM INFINITAS, quam anno 1671 de his rebus scripseram] quâ æquationum exegesi instituo reducendo eas ad series infinitas.*”—

7. Alteram quoque epistolam, 13 Jun. 1676, scripsit *Newtonus* ad *Oldenburgum*, cum *Leibnitzi* communicandam, in quâ celeberrimum *Theorema Binomium*, primò, absque demonstratione proposuit, (nec unquam postea demonstratione ipse munivit) cujus ope nimirum, “*æquationum illam exegesi*” potissimum, instituerat. Hoc autem, ex intimis penetralibus fluxionum haustum, *Newtono*, saltèm ante *Pestem Londinensem*, anno 1665, innotuisse, antea memoravimus, *ANALYS. ÆQUAT. p. 33. not.* Vide quoque § 96 hujus.—Cæterum hæc duæ epistolæ, *Leibnitzianam* illam Jan. 21, 1677, tempore antegressæ, *primi inventoris* honorem *Newtono* servare videntur; nec inficiabitur æqua posteritas.

8. De famâ *Leibnitzi* plus æquo forsàn detrectans, cœtus *Analystarum Anglicorum* adjudicavit, “*That in the letter of 10th December 1672, from Newton to Collins, the method of fluxions was sufficiently described to any intelligent person.*”—Verùm, si “*hæc methodus satis in istâ epistolâ descripta fuit ut ab aliquo harum rerum modicè perito posset intelligi, quæri potest,*” cur *Newtonus*, anno 1677, ad æmulum suum “*intelligentissimum* certè atque *peritissimum*” *Leibnitzium* scribens, anagrammate quodam *methodum suam fluxionum directam* diutiùs celaret?—Disputationes sanè quæ adhuc, etiã nostro ævo, vigent de evidentiâ et certitudine hujus methodi, inter *Analystas* perspicacissimos, scholæ tam *Newtonianæ* quam *Leibnitzianæ*, (non obstantibus, vindictis, expositionibus, et commentariis discipulorum *Newtoni* celeberrimorum) satis ostendunt cur tam tardè eruantur, quæ tam altè jacent.—*Seneca.*

Adde quod, si verum fuisset, quod ex scriptis *Newtonianis* primos theoriæ suæ igniculos elicuerat *Leibnitzius*, haud mediocris laus idcirco illi concedenda videretur, qui arcanum molestissimum et longè difficillimum in lucem ex tenebris proferre poterat:

*Quem vituperare ne inimici quidem possunt, nisi ut simul laudent.*

9. Veruntamen tutò colligere licet, neque *Newtonum* neque *Leibnitzium* pro inventore absolutò hujusce methodi habendum esse; nam si manifestò constet,

B

utrumque

utrumque methodum suam à methodo ducendi Tangentes Barrovianâ mutuâsse; nonne utrique laudem pleni perfectique ab integro inventoris, detrahet æquus controversiæ judex?

Audiamus *Leibnitzium* in epistolâ quâdam April 9, 1716, datâ :

“ M. *Newton* hazarde icy un accusation qui va tomber sur lui-même : Il prétend que ce que j’ay écrit pour lui à M. *Oldenbourg* en 1677 est un déguisement de la méthode de M. *Barrow*. Mais, comme M. *Newton* avoue dans la page 253 et 254 de la première édition de ses principes:—“ Me, [*Leibnitzium*] ipsi [*Newtono*] tunc methodum communicâsse à methodo ipsius vix abludentem præterquam in verborum et notarum formulis’—“ il s’ensuivra que sa méthode aussi n’est qu’un déguisement de celle de M. *Barrow*.”—Et non infelicitèr sanè retorquetur à *Leibnitio*; *Newtonum* enim potius mutuâsse ab amico, socio, studiorumque patrono, ipsiusque prædecessore in munere professorio *Lucasiano* CANTABRIGIÆ, optimo eruditissimoque *Barrow*; quàm *Leibnitzium* suam methodum ab eodem *Barrow* derivâsse, scriptore, scilicet, quoad *Leibnitzium* peregrino et fortasse parùm noto, longè verisimilius est.

10. Quantum verò debuit *Newtonus* antecessoribus suis, ipse haud rarò ingenuè fatetur—modestiâ quàm ingenio non minùs spectabilis. Debuit *Stusio* quidem in methodo Tangentium, imprimisque *Barrow*, in methodo ducendi Tangentes per triangulum arithmeticum; *Nicolao Mercatori*, in Logarithmotechniâ, quam à divisione fractionum ad extrahionem radicum per theorema binomium, extendit *Newtonus*; *Hugenio*, “ in eximio suo tractatu de horologio oscillatorio,” cujus methodum determinandi vires centripetas et centrifugas corporum revolvantium in circulis, ad vires corporum revolvantium in curvis quibuscunque, solertissimè extendit *Newtonus* per circulos ejusdem curvaturæ; debuit etiâ *Walliso*, in quadraturâ curvarum, reducendo ordinatas irrationales ad rationales, per series infinitas; *Fermatio*, in solutione problematum de maximis et minimis; *Cavallerio*, in methodo indivisibilium; atque ipsi *Cartesio*, in applicatione *Algebrae* ad *Geometriam*, quam ipse tantoperè auxit, atque ad mechanicam rationalem, (seu “ scientiam motuum qui ex viribus quibuscunque resultant, et virium quæ ad motus quoscunque requiruntur, accuratè propositam ac demonstratam ”)—solertissimè extendit et accommodavit.

11. Magnus sanè habendus est ille inventor, qui obscura et involuta scientiæ arcana, arte suâ indagatrice, enucleavit et detexit, lucem ex tenebris promens; major tamen esse videbitur, si ipse expositor, quæ detexit, ea noverit et voluerit certâ ac idoneâ ratione demonstrare;—“ analysi brevissimâ et simul perspicuâ, synthesi concinnâ et minimè operosâ,” qualem exercebat olim magnus ille *Geometra Apollonius*, in libro suo eximio de Sectione Rationis, testante *Halley*; atque minimè deficit ab ejus vestigiis *Newtonus*, in Lemmate II. Lib. II. Princip. imperatoriâ quâdam brevitate, et lucido ordine, fundamentum methodi suæ generalis fluxionum positurus.

12. Veruntamen fatendum est, quod *Newtonus*, nimis forsân brevitatis studiosus, et moram et molestiam interpretandî refugiens, non nisi “ peritos alloquens,” semina tantùm expositionis veræ atque genuinæ sevit, à posteris serò explicanda in frugem.

frugem uberiores justæ atque legitimæ demonstrationis, ubi “*Opinionum commenta deleverit dies*,” et tandem, post lapsum annorum centum, consensu communi sectatorum scholæ *Newtonianæ* et *Leibnitzianæ*, methodi ipsius generalis sive *fluxionclis* sive *differentialis*, rudimenta melius intelligantur, ejusque elementa prima “*quæ tam altè jacent*,” imis in penetralibus scientiæ *metaphysicæ*, cautiùs atque curatiùs “*erueret*,” et argumentis idoneis et ad naturam scientiæ illustrandæ accommodatis tandem confirmare, fas sit.

13. Neutiquam cuivis homini contingit inventa sua, à primordiis ad ultimum perfectionis statum, spatio vitæ vel longissimæ perducere. Artis scientiæve cujusvis elementa simul invenire, et inventa demonstrare, vel maximis ingenii rarissimè concessit Deus. Gradatim et seriatim fit VERITATIS exploratio.—“*Plantabat Paulus, irrigabat Apollo, sed Deus augebat*”—haud minùs verum est in *Philosophiâ* quam in *Religione*.

“*Felix*” quidem censendus est, “*qui potuit*” vel *paucos* annulos arripere tantum, eisdemque *infimos*, immensæ illius catenæ VERITATUM ÆTERNARUM, quam à cœlis ad tellurem usque demisit, ægris mortalibus et hallucinantibus, benignus ILLE DEUS, qui variis gaudet nominibus—Ο ΛΟΓΟΣ ΤΟΥ ΘΕΟΥ, Ἡ ΣΟΦΙΑ, seu “*RECTA RATIO*,” “*SAPIENTIA*,” “*VERITAS*,”—tàm apud philosophos profanos quàm apud sacros; et qui hanc catenam non viris ingenii et scientiæ suæ opinione tumidis, sed potiùs iis qui humiliùs de se sentiunt et vitæ et morum sanctitate insignes fiunt, porrigit,—*paucis* quidem “*quos æquus amavit JUPITER*”—“*Divinæ hominûmque æterna potestas*; tales versùs sese, lenitèr et indefinenter attrahens atque attollens:—alligatur enim *summus* hujusce catenæ annulus ad basin ipsius *throni divini*. Vid. *John* xii. 32.

Και ἐδικαιώθη Ἡ ΣΟΦΙΑ ἀπο τῶν τεκνῶν αὐτῆς ἀπαχθῶν. *Luk.* vii. 35.

Licet enim pusilli *Sophistæ*, seu *Pseudo-Philosophi*, *veritates æternas* haud rarè obfuscent, ipsamque “*ALMAM SAPIENTIAM*” vilipendant et obtrecent ingrati; “*indies nihilominus*,” animosè vindicatur et “*justificatur, liberis suis omnibus*” verè philosophantibus, à primordiis rerum; quales identidem prodierunt, “*lucida sidera*,” præclara lumina mundi: (b) ENOCH, NOAH, JOB, ABRAHAM, MOSES, DANIEL *Archimagus*, et PAULUS *Tarsensis*; THALES, PYTHAGORAS, SOCRATES,

(b) 1. ENOCH antediluvianus, et “*ab Adamo septimus*,” transcendenter ob pietatem vivus translatus est in cœlum, ætatis suæ anno 365mo; veros dies anni *solaris* mirè exponente; DEO forsitan, illi, quasi *astronomo*, id revelante; sicut illi, quasi *propheta*, revelavit *statum futurum*, et *judicium generale*, quæ prædixit *Enoch*, denunciavitque impiis, *Jude* xiv.—Hoc enim (licet inficiantur *semi-philosophi* et *semi-theologi* hodierni) dogma fuit SAPIENTIÆ PRIMÆVÆ antiquissimum:

Ὅτι Ὁ ΘΕΟΣ ΕΣΤΙ, καὶ τοῖς ἐκζητοῦν  
αὐτὸν ΜΙΣΘΑΠΟΔΟΤΗΣ ΓΙΝΕΤΑΙ.

“*Quod DEUS EST, et exquirentibus Ipsum  
REMUNERATOR fit.*” *Heb.* xi. 6.

Et “*ultimis quoque diebus*,” τῇ παλινγενεσίᾳ,—ubi “*magnus ab integro sæclorum nascitur ordo*”—“*dicit vir*” omnis verè philosophans:

SOCRATES, PLATO, ARCHIMEDES, et HIPPARCHUS ὁ φιλαθηναῖος; COPERNICUS, GALILEO, ROGERUS BACON et FRANCISCUS BACON, PASCAL, BOYLE, BARROW, NEWTON, MACLAURIN, COTES, DANIEL BERNOULLI, &c. &c. &c. et novissimè quidem doctissimus vir, Gulielmus Jones, eques auratus, Curiae Supremæ Britannicæ apud Calcuttam in Indiâ Justiciarius, (Gulielmi Jones, celeberrimi Mathematici sub initio hujus sæculi, filius,) *Indorum Apostolus*: qui, suis in sæculis non magis claruerunt omnes, famâ scientiæ reconditiore, quam virtutis pietatisque sublimioris; et etiamnum, unusquisque eorum ἀποθανὼν ἐτι λαλεῖσαι, “*licet mortuus, adhuc laudantium in ore est*,” honoris quoque eorum in æternum vigeat.

*De Objectionibus allatis contrâ Methodum Fluxionum à præcipuis Auctoribus qui hætenus impugnant ejusdem Evidentiam et Certitudinem.*

14. CONFESTIM à primâ expositione perbrevis *Methodi Fluxionum*, novæ, subtilioris et reconditiore, objectiones variæ suboriebantur, Analystarum tam peritorum:

“*Certe fructus est justus* :

*Certe DEUS, judicans in terrâ.*”

*Psal. lvi. 11.*

“*An JUDEX TOTIUS TERRÆ non faciet judicium?*” *Gen. xviii. 25.*

2. NOAH, magnus ille propheta et instaurator generis humani, “*qui gratiam invenit apud DEUM*,” à diluvio servatus; quod prædixit, frustra que denunciavit, 2 *Pet. ii. 5.* et fortunas Noachidarum cunctis moribundus, *Gen. ix. 25.*—Et “*Institutionis Menu*” apud Indos, (qui *Manes* est dictus apud Ægyptios,) etiamnum traditione celebrantur.—*Cyclop magnus* 600 annorum, Antidiluvianus, à *Josepho* notatus, ætatem Noæ tempore diluvii mirè servat.

3. *Job*, à Diluvio septimus (Vide *Abulfaragi*, p. 13.)—ὁ μέγας, ὀνίως ἐκεῖνος καὶ γενναῖος τῆς ἀληθείας ἀγωνιστής—“*magnus ille et nobilis VERITATIS vindex*”—*Suidas*—peritissimisque astronomus, qui constellationes cardinales sphaeræ primitivæ recenset, *Job ix. 9.* et xxxviii. 32. AISI, CHIMAN, CHESIL et MAZARON, sive “*Ursa Major, Taurus, Scorpio et Canis*” respectivè; ut videre licet in opere quodam an. 1799 edito, cui titulus, *THE INSPECTOR*—*London, White.*

4. ABRAHAM, “*Amicus ille DEI*,” et “*Pater fidelium*,” idemque peritissimus astronomus; sicut per totam Orientem adhuc celebratur:—Λοκηθεῖς, κατὰ τὸν πάλαιον νομὸν; τὰς τῶν ἐποφανίων ἀστρονομικῶν καὶ σοφασομένων ὡς αἱ ἐν ταῖς ἰσλαμικαῖς τοῦ μεγάλου τῆς φαίνουμένης ταύτης κλίσεως, ἀλλὰ ἔχει τινὰ τὸν ΔΗΜΙΟΥΡΓΟΝ καὶ κινεῖα καὶ διευθυνοῖα τὴν ἐναρμονιστικὰν ἀστρονομικὴν πορείαν, καὶ τὸ κόσμῳ παρὸς τὴν κάταστασιν.

“*Exercitatus, patrio more Chaldaeorum, in astrorum motibus observandis; atque conjecturâ affectus est, quod non in his ipsis consistit vis magna effluviæ apparentis. hujusce creationis; sed quod potius habet aliquem OPIFICEM PUBLICUM, qui et movet et dirigit harmonium astrorum cursum et mundi universi constitutionem.*”—*Suidas.*

5. MOSES,—maximus ille legislator, “*in omni sapientiâ ÆGYPTIORUM instructus*,” qui institutione *Pasche*, (Deo forsàn revelante,) cyclum illum decennovalem lune, celeberrimum tradidit, in computandis noviluniis, et paschalibus pleniluniis, apprèhe necessarium; cujus ope, *Meton*, longo post tempore, Calendarium *Atheniense* emendavit.

6. DANIEL.

peritorum quàm imperitorum, validitatem ejus denegantium; ac, (non obstantibus magnis illis Newtoni discipulis,—COLSON, qui anno 1736, *Newtoni Methodum Fluxionum Analyti Aequationum per series infinitas intertextam*, versione Anglicâ et commentario copioso donavit et illustravit;—MACLAURIN, qui anno 1742, *Tractatum suum Fluxionum*, Anglicè edidit, fundamentum totius methodi generalis à primordiis ad mentem *Newtoni* in *Lemmate Secundo*, Lib. II. Princip. explicare professus;—et STEWART, qui anno 1745, duo ipsius Newtoni celeberrima opera, *Analytin Aequationum per series numero terminorum infinitas*, et *Quadraturam Curvarum*, versione Anglicâ et commentario uberrimo instruxit;—aliisque scholæ *Newtonianæ* discipulis celeberrimis, *Simpson*, *Saunderson*, *Emerson*, *Waring*, &c.) adhuc vigent objectiones tam nostratium *Berkeley*, *Landen*, &c. ac nuperrimè scriptoris doctissimi in libro censorio, singulis mensibus edito, cui titulus, *The Monthly Review*; quàm exterorum *D'Alembert*, *Torelli*, *La Grange*, &c. optimorum, scilicet, expositorum *Methodi Differentialis*, et acerrimorum obrectatorum *Methodi Fluxionum*.

Et certè fatendum est, non obstantibus tot commentariis tantorum Analytarum, qui fines Fluxionum magnoperè extenderunt, hætenùs desiderari ipsius *Textûs Newtoniani*, (brevissimi ac reconditissimi,) interpretem fidum atque perspicuum, methodi et lucidi ordinis ab ipso auctore instituti strenuè sequacem, et expositionem nec nimis curtâ, nec nimis prolixâ, difficilia illustrantem; (vitia, quæ utcumque sibi mutuò contraria videantur, tamen haud rarò simul et semel inveniuntur;) ac de sensu nativo ipsius authoris eruendo, quàm de suâ eruditione aut facundiâ ostentandâ, magis sollicitum.

6. DANIEL ille *Archimagus*, in omni sapientiâ et disciplinâ *Magorum* et *Chaldæorum* instructus, atque ita celebratus ut "*sapientior Daniels*" in proverbium est erectum, per totam Orientem, *Ezek. xxviii. 3.*—Et in Sacris Scripturis honoratissimè distinguuntur—"Noah, Daniel et Job"—quasi præpotentes *intercessores* cum DEO—*Ezek. xiv. 14.*—Noah, pro se suâque familiâ, liberatis ab excidio diluvii—Daniel, pro reditu *Judeorum* Captivorum;—et Job, pro amicis suis tèmèrè philosophantibus, et PROVIDENTIAM DIVINAM ignavè vindicantibus.

7. PAULUS *Tarsensis*—"apud pedes *Gamalielis*, celeberrimi præceptoris *Judeorum*, educatus;" *Act. xxii. 3.* et in omni disciplinâ scholarum philosophicarum *Alexandriæ*, *Athenis* et *Romæ*, non levitèr instructus.

8. THALES, eclipsin illam solarem prædixit, quæ diremit pugnam inter *Lydios* *Medosque* commissam, *Julii 30, anno 607, ante æram Christi vulgarem*, (ut posthac forsân probare mihi dabitur occasio in *dissertatione* quâdam *De Chronologia Antiquâ*, mox edendâ—si DEUS *dei vitam, dei opes*)—epochâ, nimirum, ab astronomis chronologisve hætenùs non satis notatâ. Hanc verò eclipsin, tantoperè litigatam, facilè computare potuisset *Thales*, ope *Cycli* illius *Decemnovalis*, ex *Judeis Chaldæisve* mutuati—à *Græcis* et *Metone*—qui accuratius constabat ex *lunationibus* 223, spatio *annorum* 18 cum diebus 11, peractis—quem figuratè et aptè innuit *Theocritus*, *Idyll. XV.*

*Ὀὐρανὸς ἀδεύει; ἡ ἐννεακαιδεκὴς ἐ γαυρεῖ.*

De nuptiis *Adonidis* loquens, seu *conjunctionibus Solis et Lune*—"οὐδεκάτοιο ἢ ἑνδεκάτοιο ἔτει."

9. PYTHAGORAS, ille *Samius*, cujus allegoriam eximiam de semitis vitæ divergentibus ad veritatem vel ad errorem, per furculas literæ T, designatis, notat *Perfus*, *Sat. III. 56.*

*Et tibi quæ SAMIOS deduxit littera ramos,  
Surgentem DEXTRO monstravit limite collem.*

Quam lucubrentissimè exponere non dedignatus est ipse JESUS CHRISTUS, *Mat. vii. 13.*—Verum quoque mundi systema, seu *Copernicanum*, aut detexisse, aut saltè ex *Chaldæis* didicisse, videtur.—Vide *Maclean's Account*, *Chap. 2.*

15. Audiamus THE MONTHLY REVIEW, in eruditâ admodum recensione suâ libri cui titulus *Theorie des Fonctions Analytiques*, par La Grange, Paris 1798. Art. 1. Append. Vol. 28.

“*The Method of Fluxions* had never so acute, so learned, and so judicious a defender as *Maclaurin*.—His work is most valuable for the variety of information which it contains, and for many species of clear and forcible argumentation: yet whoever consults it, and sees the various *artifices* which he is obliged to employ for the purpose of demonstrating the several parts of the method; and the grounds of it not established in less than *fifteen long theorems*; and, in an enquiry *purely mathematical*, finds the author speaking of “causes and effects,” “of the springs and principles of things,” and proposing to deduce “the relations of quantities by comparing the powers which are conceived to generate them;”—will be convinced that this could only happen from so able a mathematician having failed to seize *the right principle* and the *true mode of explanation*.”

16. Atque hujus acutissimi censoris sententiæ multis nominibus accedo: nam, primò, à verâ interpretandi viâ deflectens, *Maclaurinus* illustrationibus geometricis, à naturâ *motûs* petitis, nimis immoratur in libro primo; longo sermone luxurians, et argumentationis ambagibus ad fastidium usque indulgens, à genio *Newtoniano* prorsus alienis; qui *methodum suam Fluxionum* excogitavit, “*ut effugeret tædium deducendi longas demonstrationes, more veterum geometrarum, ad absurdum*;”—et “*contractiores*” his, et simul accuratiores illis quæ per *methodum indivisibilium* à Cavallerio ejusque discipulis eliciebantur, magno scientiarum emolumento, substituit. Contrâ, dum brevis esse laborat, obscurus fit *Maclaurinus* in libro secundo; et, quasi interpretandi per-tæsus, primo hujus capite, strictim tantum, principiis veris ac genuinis methodi universalis, (ex naturâ *relationum* quantitatum variabilium abstractè consideratarum, manantibus,) vix, aut levitèr tantum notatis, *elementa prima* seu *metaphysica*, à *Newtono* posita, festinantèr transcurrit; et *principia mathematica* quoque nimis et præproperâ celeritate absolvit; et denique, ipsius inventoris lucidum ordinem statim ab initio deferens, multa mutat; et quæ mutat, corrumpit: nam,

2. Prop. 1. Totius theoriæ suæ fundamentalem, § 707, “*fluxionem quadrati  $A^2$ , æquari  $2aA$* ;” non nisi imperfectè demonstrat; unde enim hanc fluxionem *assumpserat* (*c*), minimè ostendens, transit, per saltum, ad demonstrandam veram fluxionem hâc, nec *majorem* esse, nec *minorem*, argumento ad absurdum prolixiore usus.

(*c*) The defect of *Maclaurin's* demonstration may thus be supplied, from his own principles rightly conceived, though rather confusedly expressed, § 701—706.

§ 707. Prop. 1. *The fluxion of the root A being supposed equal to a, the fluxion of the square AA will be equal to 2aA.*

Let  $A - a$ ,  $A$ , and  $A + a$ , be successive values of the variable root; and the corresponding values of the variable square will be  $A^2 - 2aA + a^2$ ,  $A^2$ , and  $A^2 + 2aA + a^2$ ; of which the first is

usus. Et inde, § 708, "*fluxionem rectanguli*  $A + B$  *aquari*  $aB + bA$ ," pro corollario, deducit. At artifex ipse, longè elegantius atque peritiùs, auspicando à *casu primo*, et generaliore,—*fluxione* nempe *rectanguli*, inde particularem,—*fluxionem* nempe *quadrati*,—facillimè deducit, *Caf. 3.*

3. Per varios anfractus procedens, *lemmata* compluria, ad demonstrandas propositiones insequentes, tortuosè introducit *Maclaurinus*, à quibus immunis erat *Methodus Newtoniana*.

4. Ad methodum inventoris jam serò reversus, quam adè infelicitèr initib deferuerat, brevius et melius demonstrat "*fluxionem*  $A^m$  *aquari*  $naA^{m-1}$ ," more *Newtoniano*, § 716, quam imperfectè et prolixè demonstraverat antea, § 712, secutus *Prop. 1.*

5. Negligentiâ minimè condonandâ, *Theorematiz illius generalissimi, Lem. II. Lib. II. Princip. ultimum casum*, quem à præcedentibus, directo atque immediato nexu, summo acumine, summâque peritiâ Algebraicâ, deduxerat *Newtonus*, nempe, *fluxionem*  $A^m B^n$  *aquari*  $maB^n A^{m-1} + nbA^m B^{n-1}$ , prorsus omittit; itémque *tria corollaria* insequentia; elegantissima atque uberrima quidem, quæ calculo fluxionali concinnando, ubi de *proportionalibus* agitur, et de *logarithmis* præsertim, magnoperè inserviunt, eâdem negligentia omisit.

is the least, and the last the greatest. From this last value of the square subtract the first, and, the extreme terms  $A^2$  and  $a^2$  being destroyed, there will remain the *excess*  $+ 4aA$ ; which will denote the *whole* increase of the square from the first  $(A - a)^2$  to the last  $(A + a)^2$ , with the increment  $a$ , *root*, or  $2a$ ; (which is the difference between the extreme values of the root,  $A - a$  and  $A + a$ ); and consequently *half the excess*, namely  $2aA$ , will denote the increase with the increment  $a$  *once*; or will *measure the rate of variation*, or be the *fluxion* of the variable square, from its *least* to its *mean* state  $AA$ .

If you deny it, let the true fluxion be either greater or less than  $2aA$ , by any assignable difference  $D$ , or equal to  $2aA \pm D$ . But if greater, the last increment must necessarily be greater than  $+ 2aA + a^2$ ; if less, the first increment must be less than  $+ 2aA - a^2$  (or the difference between the first and mean values of the variable square), contrary to the hypothesis. Q. E. D.

In numbers the case is plain:

Let the root  $A = 10$ ; and its momentary increment  $a = 1$ .

Val.	Diff.
$(A - a) \times (A - a) = 9 \times 9 = 81.$	} 19
$A \times A \dots \dots \dots = 10 \times 10 = 100$	
$(A + a) \times (A + a) = 11 \times 11 = 121$	} 21
But $\dots 4aA \dots = 4 \times 10 = (40 =) 19 + 21.$	
Therefore $2aA \dots = 2 \times 10 = (20 =) \frac{19 + 21}{2}.$	

Consequently  $2aA$  expresses the *fluxion* or *rate* of increase of the variable square in its advance to the *mean* state  $A \times A$ .—The demonstration might be abridged upon *Newton's* principles, by taking only the half increment:—For the least value  $(A - \frac{1}{2}a)^2$  becomes  $A^2 - aA + \frac{1}{4}a^2$ , and the greatest,  $(A + \frac{1}{2}a)^2 = A^2 + aA + \frac{1}{4}a^2$ . But the excess,  $+ 2aA$ , gives the *fluxion* at once, during the *whole* momentary increase. See § 84 and 85.

17. Diluendis igitur objectionibus eorum qui methodi fluxionum generalis evidentiam atque certitudinem impugnant, omnino imparem esse commentarium *Maclaurini*, quamvis valdè eruditi, et in hisce scientiis versatissimi, et (quod auctoritatem majorem ipsi parere debere super hoc argumento videatur,) in ipsius *Newtoni* amicitiam (d) admissi, quis mathematicus non videt?—At non levi detrimento theoriæ fluxionum, iste commentarius fusior, qualis qualis fuerit, mox supplantavit originalem textum, paulò subtiliorem atque difficiliorem intellectu, ob *impratoriæ* auctoris *brevitatem*, non nisi auribus rite purgatis capiendam—

Φωσφωρὸς στυγερὸς.

Ex hoc fonte igitur profluxerunt vel perspicaciorum peritiorumque analytarum objectiones, scholæ *Leibnitzianæ* præsertim, adversus ipsam fluxionum methodum; quasi methodo *differentiali*, evidentiâ et certitudine, cedentem, et in principiis à geometriâ alienis fundatam.

18. Audiamus *D'Alembert*, analytici adeò celebratum, in *Mathefi* perspicacissimum, in *religione* hebetissimum, argumento paulò subtiliore validitatem exponendi *fluxiones* per velocitates, impugnantem:

“Introduire ici le mouvement, c'est y introduire une idée étrangère, et qui n'est point nécessaire à la démonstration: d'ailleurs, on n'a pas d'idée bien nette de ce que c'est la vitesse d'un corps à chaque instant, lorsque cette vitesse est variable. La vitesse n'est rien de réel, c'est le rapport de l'espace au tems, lorsque la vitesse est uniforme; mais lorsque le mouvement est variable, ce n'est plus le rapport de l'espace au tems, c'est le rapport de la différentielle de l'espace à cette

(d) The following letters of *Newton* reflect high honour on his liberality of mind and delicacy of friendship towards the excellent *Maclaurin*, when a candidate for the joint *Professorship of Mathematics* in the University of *Edinburgh*.—In one of these letters, addressed to Mr. *Maclaurin*, (with permission to shew it to the Patrons of the University,) Sir *Isaac* expresses himself thus:

“I am very glad to hear that you have a prospect of being joined to Mr. *James Gregory* in the Professorship of the Mathematics at *Edinburgh*, not only because you are my friend, but principally because of your abilities; you being acquainted as well with the new improvements of Mathematics, as with the former state of those sciences: I heartily wish you good success, and shall be very glad of hearing of your being elected. I am, with all sincerity, your faithful friend and most humble servant.”

In a second letter, which was addressed to the then Lord Provost of *Edinburgh*, (which Mr. *Maclaurin* knew nothing of till some years after Sir *Isaac's* death,) he thus writes:

“I am glad to understand, that Mr. *Maclaurin* is in good repute amongst you for his skill in Mathematics; for I think he deserves it very well: And, to satisfy you that I do not flatter him, and also to encourage him to accept the place of assisting Mr. *Gregory*, in order to succeed him, I am ready (if you please to give me leave,) to contribute twenty pounds per annum towards a provision for him, till Mr. *Gregory's* place becomes vacant, if I live so long, and I will pay it to his order in *London*.”

See an *Account of the Life and Writings of Maclaurin*, prefixed to his *Account of Sir Isaac Newton's Philosophical Discoveries*, in which are many curious and valuable particulars of the life of that CHRISTIAN PHILOSOPHER, especially in his last moments; so different from those of that miserable infidel *D'Alembert*.—APPENDIX II. § 161 & 164.

du

du tems ; rapport dont on ne peut donner d'idée nette que par celle des *limites*. Ainsi il faut nécessairement en revenir à cette dernière idée, pour donner une idée nette des *fluxions*."

19. Quinquaginta retrò annis circitèr, talia objecit vir clarissimus *D'Alembert*, cujus auctoritas nunc tanti æstimatur. Ac nuperrimè quidem, ("vires enim acquirunt eundo,") maximus ille promotor *Algebræ puræ*, nec non analysecos sublimioris, *De La Grange*, in opere quodam elementari, cui titulus, *THEORIE DES FONCTIONS ANALYTIQUES*, 1798, *Paris*, autumat se ferò tandem vera et genuina principia *calculi differentialis* extudisse, ab omni consideratione sive *quantitatum infinitè parvarum*, seu *evanescentium*, sive *limitum vel fluxionum*, libera atque immunia ; usurpando tantùm *Quantitatum finitarum Analysin Algebraicam*.

20. Hicce magni nominis viris consentiens *Landen* nostras, ita doctrinam fluxionum perstringit in *Analyti suâ residuâ*, anno 1758—Analysta et ipse ex peritissimis.

"It seems more proper, in the investigation of propositions by *Algebra*, to proceed upon the *anciently-received principles* of that art, than to introduce therein, *without any necessity*, the *new* fluxionary principles derived from a consideration of *motion* : and the rather, as the introduction of these new principles is not attended with any *peculiar advantage*."

21. Tantis opponentibus accedit quartus,—nimirùm *censor* ille, in hicce scientiis non levitèr versatus, (quisquis fuerit,) apud *THE MONTHLY REVIEW*, *Append.* Vol. 28, 1799,—ex cathedrâ moderatoris, ita pronuncians judicium, in *Newtonum* ejusque commentatores et discipulos :

"Of the *Method of Fluxions*, properly so called, *Newton* is the sole and undisputed inventor ; to him, beyond all doubt and controversy, is to be attributed the *establishment* of that doctrine on the consideration of *Motion*.

"Had not *Newton* been the inventor of *this* method of considering Fluxions, we are of opinion, that very few persons would have contended either for its *metaphysical* or *mathematical* excellence : for, on the ground of perspicuity and evidence, the understanding is not much assisted by being directed to consider *all* quantities as generated by *Motion*. *Lines* we can conceive generated by the motion of *points* ; *surfaces*, by the motion of *lines* ; &c. But when such quantities as *Weight*, *Density*, *Force*, *Resistance*, &c. become the objects of enquiry, and are said to have their *flux* and *velocity*, then the true end of the *figurative* mode of speech—*Illustration*—is lost : On the ground of *mathematical* convenience—that the definition of Fluxions, as given, is commodious to deduce thence their properties and affections—nothing is gained ; since the enquiry is reduced "*ultimately*" (*en dernière analyse*) to the determination of *the ultimate ratio* of vanishing quantities, or of *the limits* of such quantities : which latter method is only the former, *algebraically* expressed.

C

"That

"That which happened to *Aristotle* has happened to *Newton*: His followers have bowed so implicitly to his *authority*, that they have not exercised their *reason*.—If the *English* Mathematicians first adopted *Newton's* Method from veneration to him, or *for want of better information*, they have since persevered in it, (we may almost say) *against conviction*.—

"It has been said, that *the true principles of any invention are most satisfactorily and truly stated by the inventors themselves*;—yet it is at the distance of more than a hundred years from the discovery of the *Fluxionary Calculus*, that its principles are first clearly and rigorously established. It has been reserved for the Mathematicians of *these days*, to effect what was denied to a *Newton* and a *Leibnitz*; and to supply to their theory that evidence and exactness, the want of which makes us attribute its invention rather to the felicity of the times in which they lived, than to the excellence of their genius:—to esteem it, not *pro partu ingenii*, but *pro partu temporis*."

22. Eruditorum sanè graves sunt hæ objectiones, et gravitèr pronunciatæ. Veruntamen, non obstantibus tantis iudiciis, et posthabita omni *auctoritate*, (quæ in MATHESI minimè valere debet,) fidentèr affirmare ausim, propriis ex investigationibus, *Nullius addictus jurare in verba magistri*—à nemine, ne vel ab ipso *De La Grange*,—evidentiùs, accuratiùs, solidiùs, invictiùs et generaliùs, strui fundamentum totius *Theoriæ Fluxionum*, quàm à celeberrimo inventore, *sagacissimi ingenii* viro; si modò, missis aliorum commentis, adeamus ipsius *textum originale*; nam, si attentè et circumspectè hic textus inspiciatur, et, contextu examinato, cæterisque auctoris documentis criticè collatis, probè intelligatur, terminis technicis aptè definitis, atque ellipsis ritè suppletis, (quæ causæ sunt ex quibus præcipuè difficultates in Newtoni scriptis oriuntur) censebit, nì fallor, omnis æquus peritùsque controversiæ hujus judex, objectiones hæcenus prolatas, vel gravissimas, ex inscitiâ potiùs, ex imperitiâ, præjudicio, vel livore, quàm ex justis ratiociniis et veritatis perceptione ortas esse; imò in ipsos objectores jure retorqueri posse.

23. Analystas *exteros* quidem, eosdèmq; *Gallos*, *nomini Britannico* olim infensos et nunc acerbissimè,—*D'Alambert* aut *De La Grange* (c)—ipsius *Newtoni* æmulos minimè impares, de laude ejus detrectare voluisse, non est mirum; qui  
nec

(c) DE LA GRANGE.—Quindecim retrò annis, hæc notabam fides NEWTONI discipulus. ANALYS. ÆQUAT. § 259.

"Ex dictis facillè judicabit lector, an valent multi nominis viri *La Grange* objectiones. *Dissert. Acad. Berlin*, an. 1768: nempe quod methodo *Newtoniana* [extrahendi radices æquationum quàm proximè, in *Analyßi* Æquationum per series infinitas, quàm demonstratione generali munieram § 249—259.] ignoratur quantum ad veritatem accedit tùm valor (*k*) primò assumptus, tùm valor cujusque complementi insequentis (*p*), (*q*), &c.—Methodus certè quam ut accuratiorem commendat, *Newtonianæ* facilitate longè cedit; quippe quæ ex inventione quantitatis  $\sqrt{I}$ , § 234, non nisi per tentamina,

nec raro nec parcè, quamvis furtim, inventiones ejus reconditissimas enucleare compotes, ad se suosque transtulerunt: Cæterùm hîsce temerè consentire Analystas *Britannicos*, auctoritati alienæ ignavè succumbentes, pudet dolétque. Horum sanè adscribi ordinibus *Landen* patiamur forsàn, qui suis studiis, suisque opinionibus nimis et pertinacitèr erat addictus, ita quòd *Analysin* suam *residualè*, (quâ tantoperè delectabatur,) ipsi *Methodo Fluxionum*, (cujus larva tantùm habenda sit, ut mox ostenditur,) arrogantèr et falsò anteposuerit; et qui, cum Analystæ, hujus ævi, celeberrimi, *D'Alembert* et *Euler*, adstipulantibus *Wildbore* et *Eriss*, communi consensu, ex diversis principiis, determinârant eandem veram quantitatem *motûs corporis circà axem liberè rotantis, ubi actione vis cujusdam extrinsecæ, aut percutientis aut accelerantis, perturbatur*—suam conclusionem, ab eorum conclusione non modicè dissentientem, eorum auctoritati quadruplici opponere ad mortem usque non desit; pertinaciæ exemplum præbens, quòd maximis ingeniis haud rarò contingit, plus æquo “*sibi fidentibus aliâque spernentibus*.” At verò *censorem publicum*, apud M. R.; ipsûmque, ut ferunt, *Professorem Matheseos Academicum*, ita peccâsse, minimè condonandum est. Valdè equidem suspicor, illum, *λογω αργω*, “*ignavâ ratione*” seu negligentiâ, ex nimia et præproperâ mentis festinatione, hæc opinionum commenta

*tentamina*, valdè laboriosa in æquationibus altiorum demensionum, eruendæ, auspicatur; per inventionem *Limitum Æquationum* ex binomiis compluribus successivè substituendis, procedit; et per combinationem plurium fractionum continuarum, ex his operationibus elicitarum, concludit.”

Quantâ autem comitate, quanto animi candore sustinuit *Vindicias* hæc *Newtonianas*, haud temerè excitas, animadversionesque certè non leves; ex insequenti patebit epistolâ, quam mihi, homini obscuro, post acceptam *Analysin Æquationum*, scribere non dedignatus est vir clarissimus. Hanc verò, in scripsiis meis hæcenus latentem, edere jam libet, minimè jactantiæ gratiâ,—studiis meis diù conversis, *MATHESES* relictâ, in *MUSAS HEBRÆAS*—“*quarum sacra fero, ingenti percussus amore*”—“*smit with the love of sacred song*”—sed quâ par est observantiâ; ne cuius *Vindicias secundas* legenti nascatur suspicio, me, animo utcunque infenso, similitate quâvis, aut odio hostili, denegare velle grata “*præmia laudis*” tam insigni: quem ex peritissimis Newtoni successoribus, (excepto forsàn *La Place*) maximisque *Algebræ puræ* et *Analysos* sublimioris hoc ævo cultoribus, facilè principem, concedere cogor *Britannus*, et non inficiabitur æqua posteritas:

MONSIEUR,

Berlin, Nov. 1. 1785.

*Agréer mes très sincères remerciemens de l'honneur que vous m'avez fait en m'envoyant votre ANALYSE DES ÉQUATIONS; que j'ai lue avec toute la satisfaction possible. La clarté et la précision qui regnent dans cet ouvrage, et la réunion qu'il présente des METHODES ELEMENTAIRES et des THEORIES SUBLIMES doivent lui donner un des premiers rangs parmi ceux de son genre; et par l'intérêt que je prends aux progrès de la GEOMETRIE, je partage la reconnaissance que vos COMPATRIOTES vous doivent pour ce travail. Je desirerois fort pouvoir mériter l'opinion avantageuse que vous voulez bien avoir de moi, mais je ne puis y répondre, que par la véritable estime, et la considération distinguée avec laquelle, j'ai l'honneur d'être,*

MONSIEUR,

*Votre très humble et très obéissant serviteur,*

DE LA GRANGE.

Neque existit ratio quævis, cur (in Mathematicis saltèm) animo infenso judiciis censorum eruditum M. R. meum opponerem, qui satis supèrque laudabant ANALYSIN ÆQUATIONUM in recensione tractatûs illius, eodem circitèr anno; sed cum ambitiosè in lucem proferuntur *Extorum* opera Mathematica—Cursus Mathematici *Sauri* et *Bezart*; Institutiones Analyticæ *Euleri* et *Clairaut*, *De La Place* et *De La Grange*; at *Nostratum*, fastidiosè in umbram relegantur, iniquâ forsàn comparatione, à censoribus *Britannis*; cur non mihi æquo saltèm jure liceret vicissim, asserere tanti censoris *Galli* testimonium, de una saltèm institutione elementariâ—etiâ *Hibernâ*?

ex aliis potius temerè assumpsisse : idque vel ex meâ ipsius fortunâ in hac re verisimile mihi videtur, cui contigit adolescenti *Rudimenta Fluxionum* ex *Maclaurin's Treatise of Fluxions* didicisse; et qui non nisi anno superiore (1798), tandem, cum fortè curiosius ipsum textum *Newtonianum* inspexissem, atque ipsius auctoris simplicitatem elegantiamque demonstrandi, cum commentatoris prolixitate et ambagibus, contulissem, sententiam super hac re mutare sum co-actus, et à commentatoris partibus in ipsius auctoris partes transire, et cum admiratione exclamare,

*Homo homini quid præstet!*—Inventor  
Interpreti quanto antecellit!

24. Et mecum quidem et sentit et loquitur *Colson*, (Methodi Fluxionum *non sordidus auctor*) hîcce verbis :

“ The principles of the method here taught have been *scrupulously examined* and sifted, have been *vigorously opposed*, and, we may say, *ignorantly rejected* as insufficient, by *some* mathematical gentlemen, [*Berkeley, &c.*] who seem not to have derived their knowledge of them from *their only true source*; that is, our *author's own treatise*, written expressly to explain them.”

25. Placet igitur, resuscitatis hodiè objectionibus obsoletis, novisque ingruentibus, et per *Angliam*, orbemque literarum, à *Galliâ* grassantibus, totam methodum fluxionum ab ipsis fontibus, tam *metaphysicis* quàm *mathematicis*, ab integro ad examen rigidum revocare; ut, his perspectis et per scrutinium investigatis, ne diutius falsis laboret criminibus evidentia ejus et certitudo; neque *injuriæ pede proruant stantem columnam laudis NEWTONIANÆ*, vel imperiti vel invidi, sublimem et subtilissimam methodum ex sacris fontibus ANALYSEOS ANTIQUÆ haustam promotamque, quasi “ *partum temporis*” abortivum, ex elementis incongruis conflatum, atque caducum, insimulantes, et non potius “ *partum ingenii*,” divinitus conceptum, atque ad statum parturæ maturum atque perfectum, plenitudine temporis in lucem editum, *heredem immortalitatis*, venerantes.

26. Nec minùs urget impellitque sollicitudo, curaque non levis, NE QUID DETRIMENTI CAPIAT RESPUBLICA—influxu hoc infausto *opinionum Gallicarum*, tanto studio, tantisque illecebris, tantoque auctoritatis pondere, PHILOSOPHIAM BRITANNICAM invadentium; et nisi maturè et strenuè et peritè, “ *zelo secundum scientiam*” repellantur animosè, et rejiciantur indignantèr, IPSAM unà cum RELIGIONE ILLA, (cui modestè et sobriè hactenus ancillari solita est) sub erroris et impietatis fluctibus obruere minitantium.

ESTO PERPETUA!  
STATE SUPER VIAS ANTIQVAS!  
PRO FIDÈ SANCTIS COMMISSA, CONTENDITE!

27. Nec

27. Nec operam JUVENTUTI STUDIOSÆ, (nostrati potissimum) ingratham aut inutilem me præsiliturum spero, si studia *Mathematica*, jamdudum intermissa, recolens, SUBSIDIA QUÆDAM ELEMENTARIA ad *Physicam Newtonianam* (et præsertim *Astronomiam*) PHILOSOPHIÆ PRIMÆ, SACRÆQUE LITERIS, optimè consentientem, pro virili, breviter, fideliter, et tamen simpliciter perspicuèque, proponere aggrediar :

“ To illustrate *Newton* is to cultivate *real science*; and to make his discoveries easy and familiar, will be no small improvement in MATHEMATICS and PHILOSOPHY.”——*Colson*.

---

*De Methodo Rationum Primarum et Ultimarum, seu Limitum.*

---

28. TOTIUS Methodi Fluxionum fons atque origo est doctrina *Rationum Primarum et Ultimarum*, si Geometricè loquamur, seu *Limitum*, si Algebricè; ut rectè perhibent *D'Alembert* et *Censor* ille *professorius*, *Newtonum* ipsum vel secuti, vel cum eo (inscii forsàn,) consentientes; qui ita loquitur :

——“ Præmissi verò *hec Lemmata*, ut effugerem *tædium* deducendi longas demonstrationes, more veterum Geometrarum, *ad absurdum*. Contractiones enim redduntur demonstrationes per *methodum indivisibilium*: sed quoniam durior est indivisibilium hypothesi, et propterea methodus illa *minùs geometrica* censetur, malui demonstrationes rerum sequentium ad *ultimas* quantitatum evanescentium *summas* et *rationes*, *primàsque* nascentium; id est, ad *limites* summarum et rationum deducere; et propterea limitum illorum *demonstrationes*, quâ potui brevitate, præmittere: his enim idem præstatur quòd per *methodum indivisibilium*; et *principiis demonstratis jam tutius utemur*.”——“ *Vimque* talium demonstrationum ad *methodum præcedentium lemmatum* semper revocavi.”

29. Pendet sanè omnis hæc *Methodus Limitum*, ex *Lemmate primo*, *Lib. I. Princip.*

“ QUANTITATES, ut et QUANTITATUM RATIONES quæ ad *æqualitatem* tempore quovis finito constantèr tendunt; et ante finem temporis illius propius ad invicem accedunt quàm pro datâ quâvis differentiâ; sunt ULTIMO ÆQUALES.”

“ Si negas, fiant ultimò *inæquales*; et sit earum ultima differentia *D*: Ergò, nequeunt propius ad *æqualitatem* accedere, quàm pro datâ differentiâ *D*: Contrâ hypothesin.”

Q. B. D.

*Ultima*

*Ultimæ rationes* igitur, ipso definiente *Newtono*, et quàm accuratissimè, et distinctissimè, sunt "*limites, ad quos quantita'um sine limite decrefcentium rationes, 1. semper appropinquant; et 2. quas propius assequi possunt quàm pro datâ quâvis differentiâ; 3. nunquàm verò transgredi; 4. nequè prius attingere quàm quantitates diminuuntur vel augentur in infinitum.*"

30. Sedulò autem et sollicitè distinguit *Newtonus* inter harum quantitarum magnitudines ultimas, et rationes ultimas.—"In sequentibus igitur si quando facili rerum conceptui consulens, dixerò quantitates quàm minimas," vel "*evanescentes*" vel "*ultimas*," cave intelligas quantitates magnitudine determinatas sed cogita semper diminuendas *sine limite*."—Atque iterùm:—si quando quantitates tanquam *ex particulis constantes* consideravero, vel si pro *rectis* usurpavero *lineolas curvas*; nolim *indivisibilia* sed *evanescentia divisibilia*, non summas et rationes partium *determinatarum*, sed *summarum et rationum limites* intelligi.

31. Nec minùs sollicitè diluit *Newtonus* objectiones impugnantium evidentiam et certitudinem doctrinæ limitum.

Obiectio est "*Analysta*" (*Berkley*), quòd "*quantitatum evanescentium nulla sit ultima proportio; quippe quæ antequam evanuerunt non est ultima; ubi evanuerunt, nulla est.*"—Sed et eodem argumento, regerit *Newtonus*, æquè contendì posset "*nullam esse corporis ad certum locum ubi motus finiatur pervenientis, velocitatem ultimam: hanc enim, antequam corpus attingit locum, non esse ultimam; ubi attingit, nullum esse.*" At responsio facilis est: Per "*velocitatem ultimam*" intelligi, eam, quâ corpus movetur—neque antequam attingit locum ultimum et motus cessat, neque postea—sed tunc, *cum* attingit; id est, illam ipsam velocitatem quâcum corpus attingit locum ultimum, et quâcum motus cessat. Et similiter, per "*ultimam rationem quantitatum evanescentium*," intelligendam esse rationem quantitatum, non antequam evanescent, non postea, sed quâcum evanescent. Paritèr et *ratio prima nascentium*, est ratio quâcum nascuntur. Et *summa prima et ultima*, est quâcum esse (vel augeri aut minui) incipiunt et cessant. Extat limes quem velocitas in fine motûs attingere potest, non autem transgredi; hæc est velocitas ultima: Et par est ratio limitis quantitatum et proportionum omnium incipientium et cessantium. Cùm hic limes sit certus et definitus, problema est verè geometricum eundem determinare. Geometrica verò omnia in aliis Geometricis determinandis ac demonstrandis, legitimè usurpantur.

32. "Contendì etiàm potest, quòd "*si dentur ultimæ quantitatum evanescentium rationes, dabuntur et ipsæ magnitudines ultimæ.*" Hæc verò consequentia non est necessaria. Nam fieri potest ut claram ideam habere possimus relationis ultimò intercedentis inter duas quantitates quàm minimas, licet absoluta magnitudo ipsarum quantitarum nec inveniri nec concipi potest. Res clariùs intelligetur in infinitè magnis: si quantitates duæ quarum data est differentia, augeantur in infinitum, dabitur harum ratio ultima, nempe ratio æqualitatis; nec tamen idcirco dabuntur et ipsæ quantitates ultimæ, seu maximæ, quarum ista est

hæ enim, cum in immensum excreverint, omnem calculum, imò omnem magnitudinis conceptum, longè transiliunt et prorsus refugiunt.

vari possunt hæc, paulò subtiliùs forsàn et abstractiùs disputata quam  
 præ  
 meti captu, ex considerationibus *Algebraicis* et *Geometricis*, et *Aritb-*

1. In resolutione æquationum *quadraticarum*, *Analys. Æquat.* § 30. prodiit duplex radix, nempe  $x = \frac{1}{2}p \pm \sqrt{\frac{1}{4}p^2 - q}$ , eritque valor uterque realis, ubi  $\frac{1}{4}p^2$  major quam  $q$ ; uterque verò impossibilis, ubi fit *minor*; et ipso in *limite*, ubi  $\frac{1}{4}p^2$  fit *æqualis*  $q$ , erit unicus valor radices; evanescente jam quantitate radicali  $\sqrt{\frac{1}{4}p^2 - q}$ .

2. In resolutione *cubicarum* quoque, § 307, ipso in *limite*, ubi  $\frac{1}{4}p^2$  fit *æqualis*  $q$ , duplex valor factoris quadratici,  $x = -\frac{1}{2}p \pm \sqrt{-\frac{1}{4}p^2 + q}$  in unicum pariter coalescit.

34. Et ipse *Landen*, in demonstrationem suam *Theorematis Binomii*, purè *Algebraicam* (ut refert) clanculùm introducit methodum *limitum*, seu fluxionum, ubi fingit quòd “*salvâ æquatione variari potest y ad libitum, donec fiat y = x.*”—*ANALYS. ÆQUAT.* p. 38.

Nec minùs *De La Grange*, naturam radicum æquationis optimè exponens, et theoriàm æquationum *Algebraicarum* peritissimè promovens, ut docuimus *ANALYS. ÆQUAT.* § 145—148, methodum *limitum* feliciter sanè introducit.

Hinc pendet omnis inventio *limitum* vel *radicum æquationis*, vel extremarum, vel intermediarum; quorum inventio investigandis ipsis radicibus apprimè utilis est, per varias approximandi methodos.

35. In *sectionibus conicis* quoque luculentissimè obtinet *methodus limitum*; inde enim pendet omnis theoria *circulorum* et *parabolarum* curvas alias *osculantium*, ingenti cum commodo theoriæ motuum planetarum atque cometarum adhibita, à summis *Analysis*, *Newtono*, *Halley*, *Clairaut*, &c.

Nam, si concipiantur singulæ *sectiones conicæ* gigni ex intersectionibus plani per axem conì perpetuò rotantis, cum superficie conicâ vel superficiebus conicis:

1. Sectio plani generantis, aut paralleli ad basin conì, aut subcontrariè positi, erit *circulus*.

2. Circulus, rotante plano, statim migrabit in *ellipsin*; cujus eccentricitas, rotando, continuè augebitur, donec planum fiat parallelum lateri opposito conì ipsius; in hòc verò statu mutationis, ellipsis vicissim, in *parabolam*, centro in infinitum abeunte, migrabit: deinde, rotante adhuc plano, parabola statim migrabit in *hyperbolam* atque *hyperbolas oppositas*, centro sectionis jam extrinsecùs translato

translato inter vertices; et hyperbolarum eccentricitas augebitur, donec, plano cum ipso axi tandem coincidente, hyperbolæ oppositæ in *triangula verticalia* migrabunt. Atqui eadem contingent, sed ordine contrario, donec, totâ rotatione peractâ, restituitur *circulus*.

3. Hinc constat *circulum* esse limitem nascentium ellipsium; *parabolam*, evanescentium ellipsium et nascentium hyperbolarum; et *triangulum*, evanescentium hyperbolarum. Sed calculus limitum longè facilius prodit quàm calculus sectionum intermediarum; quoniam *circuli* omnes sunt figuræ similes; necnon *parabolæ omnes*; sed singulæ ellipsium vel hyperbolarum species, rotando genitæ, sunt inter se dissimiles, et diversos calculos, nempe, unaquæque species calculum sibi proprium, requirunt.

36. Ex rationibus arithmeticiis, hætenus posita quoque illustrare fas est.

1. Si data quantitas ( $2a$ ) dividatur inæqualitèr, exponente ( $x$ ) partem intermediam variabilem; erit ratio facti sub partibus inæqualibus  $(a + x) \times (a - x)$  ad quadratum semissis, ratio minoris inæqualitatis; propter defectum quadrati  $x^2$ . Per Prop. 5. Lib. 2. Elem.

Primò quidem, ratio nascentis facti seu rectanguli, (quantitate quàm maximè inæqualitèr divisâ) ad hoc quadratum, ferè infinita evadit, propter  $x$  ferè æqualem  $a$ ; dein, decrescente  $x$ , ratio rectanguli ad quadratum perpetuò accedet ad æqualitatem; et ultimò, evanescente  $x$ , ipso in limite, fiet ratio æqualitatis.

Ex. gr. Sit  $a = 101$ , et primò, variabilis  $x = 100$ ; erit rectangulum ad quadratum in ratione  $201 \times 1$  ad  $101 \times 101$ ; seu  $201$  ad  $10201$ , seu  $1$  ad  $50.7$ , hoc est, in ratione longè minore. Dein, sit  $x = 10$ , et ratio rectanguli ad quadratum jam fiet  $111 \times 91$  ad  $101 \times 101$ ; seu  $10101$  ad  $10201$ , seu  $1$  ad  $1.009$ ; propè ad æqualitatem accedente. Postremò sit  $x = 1$ ; evadètque ratio,  $102 \times 100$  ad  $101 \times 101$ , seu  $10200$  ad  $10201$ , seu  $1$  ad  $1.000,09$ , proximè ad æqualitatem accedente.

37. “Res clariùs intelligetur in infinitè magnis.”

Si eadem quantitas ( $2a$ ) perpetuò augeatur, designante jam  $x$ , augmentum variabile, erit ratio rectanguli  $(2a + x) \times x$  ad quadratum  $(a + x)^2$ , ratio quoque minoris inæqualitatis. Propter defectum quadrati constantis,  $a^2$ . Per Prop. 6. Lib. 2. Elem.

In hoc casu quoque, crescente  $x$ , ratio rectanguli ad quadratum, perpetuò ad æqualitatem accedit; et ultimò, in infinitum aucto  $x$ , fit ratio æqualitatis.

Ex. gr. Sit  $a = 1$ ; et primò sit variabilis  $x = 1$ ; erit rectangulum ad quadratum in ratione  $3 \times 1$  ad  $2 \times 2$ ; seu  $3$  ad  $4$ , seu  $1$  ad  $1.3333$ , &c. Dein, sit  $x = 10$ ; evadètque ratio  $12 \times 10$  ad  $11 \times 11$ ; seu  $120$  ad  $121$ , seu  $1$  ad  $1.008$ ; propiùs ad æqualitatem accedens: denuò sit  $x = 100$ ; et fiet ratio  $102 \times 100$  ad  $101 \times 101$ ; seu  $10200$  ad  $10201$ , seu  $1$  ad  $1.000,08$ ;

longè propiùs quàm in casu ultimo. Jam verò fit  $x = 1000$ ; et ratio ejusdem rectanguli ad dictum quadratum quam proximè ad rationem æqualitatis accedet; erit enim æqualis rationi  $1002 \times 1000$  ad  $1001 \times 1001$ , seu  $1002000$  ad  $1002001$ , seu  $1$  ad  $1,0000008$ . Denique fit valor  $x$  *infinitè magnus*; et fiet ultimò ratio rectanguli ad quadratum ratio æqualitatis; differentiâ constanti,  $a^2 = 1$ , tandem pro nihilo evadente respectu magnitudinum ipsarum adeò immensarum: hæc igitur differentia *quasi* evanescit, licèt nunquam *actu* evanescit. Claram igitur habere possimus ideam *relationis* inter duas quascunque magnitudines utcunque auctas vel diminutas in infinitum, licèt ipsarum magnitudinum *absolutarum* ideam determinatam seu positivam nullatenus effingere fas sit, mortalibus, *finitas* tantum *facultates* fortientibus.

38. Quò meliùs intelligatur natura *rationum primarum et ultimarum*, quam hic pressius exposui; principia *Newtoniana*, brevissima et subtilissima quidem, quâ potui fidelitate evolvendo; placet insupèr sententias interpretum fusiùs adducere; non solum illustrandi gratiâ, verùm etiâ ex abundanti confirmandi hætenus exposita, atque obrectatorum inscitiam plenissimè redarguendi, ex peritissimis *Newtoni* discipulis.

---

### I.—Colson's, Account of the Method of Fluxions.

---

39. "THE chief principle upon which the Method of Fluxions is built is this very simple one, taken from the *Rational Mechanics*; which is, that *mathematical quantity*, particularly *extension*, may be conceived as generated by continued *local motion*; and that *all quantities* whatever, (at least by *analogy* and *accommodation*,) may be conceived as generated after a like manner: consequently, there must be *comparative velocities* [or rates] of increase and decrease during such generations; whose *relations* are fixed and determinable, and may therefore (problematically) be proposed to be found.

"This problem our author solves by the help of *another principle* not less evident; which supposes that quantity is *infinitely divisible*, or that it may (*mentally* at least) *so far* continually diminish, as at last, before it is *totally* extinguished, to arrive at quantities which may be called *vanishing quantities*, or which are *infinitely little*, and less than any *assignable* quantity: or it supposes that we may form a notion, not indeed of *absolute*, but of *relative and comparative infinity*.

"It is a very just exception to the Method of *Indivisibles* [of *Cavalierius*], as also to the foreign *Infiniteimal Method* [of *Leibnitz*], that they have recourse at

once to infinitely little quantities, and infinite orders and gradations of these, not relatively but absolutely such: they assume these quantities *simul et semel*, without any ceremony, as quantities that *actually* and *obviously* exist, and make computations with them accordingly; the result of which must needs be as *precarious* as the absolute existence of the quantities they assume.

“*Absolute* infinity, as such, can hardly be the object either of our conceptions or calculations; but *relative* infinity may, under a proper regulation. Our author observes this distinction very strictly, and introduces none but *infinitely little* quantities that are *relatively* so: which he arrives at, by beginning with finite quantities, and proceeding by a gradual and necessary progress of diminution: his computations always commence by *finite* and *intelligible* quantities; and then, at last, he inquires what will be the result, in *certain circumstances*, when such or such quantities are diminished *in infinitum*. This is a constant practice even in *Common Algebra* and *Geometry*; and is no more than descending from a *general proposition* to a *particular case* which is certainly included in it.”

40. “And from these *easy* principles, managed with a vast deal of skill and sagacity, he deduces his *Method of Fluxions*: which if we consider only *so far* as he himself has carried it, together with the *application* he has made of it, either here or elsewhere, directly or indirectly, expressly or tacitly, to the most curious discoveries in *art* and *nature*, and to the sublimest *theories*, we may deservedly esteem it as the *greatest work of genius*, and as the noblest effort that ever was made by the human mind.”

41. “Indeed it must be owned, that many useful *improvements* and *new applications* have been *since* made by others, and probably will be *still* made, every day: for it is no mean excellence of this method, that it is doubtless still *capable* of a greater degree of perfection, and will always afford an inexhaustible fund of curious matter, to reward the pains of the ingenious and industrious *analyst*.”

42. “It should be well considered by these *gentlemen objectors*, that the great number of *examples* they will find here, to which the Method of Fluxions is successfully applied, are so many *vouchers* for the truth of the principles on which that method is founded: for the deductions are *always conformable* to what has been derived from other *uncontroverted* principles; and therefore must be acknowledged as *true*.

“This argument should have its due weight even with such as *cannot*, as well as with such as *will not* enter into the proof of the principles themselves. And the *hypothesis* that has been advanced to evade this conclusion—of *one error in reasoning being still corrected by another equal and contrary thereto*—and that, *so regularly, constantly, and frequently*, as it must be supposed to do here;—this hypothesis, I say, ought not to be seriously refuted, because I can hardly think it is seriously proposed.”—*Preface to Colson's Method of Fluxions*, p. 11.

II.—Mac-

## II.—Maclaurin's Account of the Method of Fluxions.

43. "We would not be understood to affirm that the Methods of *Indivisibles* and *Infiniteimals*, by which *so many uncontested truths* have been discovered, are without a foundation: we acknowledge further, that there is something *marvellous* in the doctrine of *Infinities*, that is apt to please and transport us; and that the Method of *Infiniteimals* has been prosecuted *of late*, with an acuteness and subtlety not to be paralleled in any other science. But GEOMETRY is best established on *clear and plain principles*; and these speculations are ever obnoxious to some difficulties: If the greatest accuracy has been always required in this science, in reasoning concerning *finite* quantities, we apprehend that Geometricians cannot be *too scrupulous* in admitting or treating of *infinities*, of which our ideas are *so imperfect*.

44. "They who have made use of *infinities* and *infiniteimals* with the greatest liberty, have not agreed as to the *truth* and *reality* they would ascribe to them.—*Cavalierius*, the ingenious author of the Method of *Indivisibles*, discovered a method which he found to be of very extensive use, and of an easy application for measuring and comparing planes and solids, and would not deprive the world of so valuable an invention. In proposing it, he strove to avoid the supposing magnitude to consist of *indivisible* parts, and to abstract from the consideration of *infinity*:—"Quoad continui compositionem, manifestum est ex præostensis, ad ipsum ex indivisibilibus componendum, nos minimè cogi: solum enim *continuum sequi indivisibilium proportionem*, et è *converso*; intentum fuit: quòd quidem cum utraq; positione stare potest. Tandem verò dicta *indivisibilium aggregata* non ita pertractavimus, ut *infinitatis rationem* propter infinitas lineas seu plana subire videantur, &c."—*Cavalieri Geom. Indivis. Lib. 7. Præf.*—But he acknowledged that there remained *some difficulties* in this matter, which he was not able to solve:—and he speaks as if he foresaw that it should be afterwards delivered in an *unexceptionable* form, which might satisfy the most scrupulous Geometrician; and leaves this *gordian knot* (as he expresses himself) to some *Alexander*."

45. "The celebrated Mr. *Leibnitz*, justly esteemed for his various writings, owns *infinities* to be no more than *fictions*:—"On s'embarasse dans les séries des nombres qui vont à *l'infini*: On conçoit un *dernier terme*, un *nombre infini*, où *infinitement petit*: mais tout cela ne sont que *des fictions*. Tout nombre est *fini* et *assignable*; toute ligne l'est le même."—*Essai de Théodicée*, disc. prélim. § 70.—They who treated of *infinities* before him proceeded, as he observes, with a *timorousness* which the contemplation of such an object naturally inspires:—

“Quand on y étoit arrivé, on s’arrestoit avec un espèce d’effroy et de sainte horreur—on regardoit l’infini comme un mystère, qu’il falloit respecter, et qu’il n’étoit pas permis d’approfondir.”—“They stop when they came to infinity with a sort of holy dread, and respected it as an unfathomable mystery.”—He, adventures farther, in order to discover the source, and penetrate into the first principles of GEOMETRICAL truth. INFINITY, according to him, is the great trunk from which its various branches are derived, and to which they all lead. In this great pursuit, he displays infinite and finite, with a freedom that puts us in mind of the ancient poet [Homer] and his gods—whom he represents with the passions of men, and mingles in their battles.”

“We doubt not that if a full and perfect account of all that is most profound in the HIGH GEOMETRY could have been deduced from the Doctrine of Infinites, it might have been expected from this author: but our ideas of infinites are too obscure and inadequate to answer this end: and there are many things advanced by all those who have applied them with great freedom in GEOMETRY, that give ground to a remark like to M. de St. Evremont’s, when he observes, that “it is surprising to find the ancient poets so scrupulous to preserve probability in actions purely human; and so ready to violate it, in representing the actions of the Gods.”—Some have not only admitted infinites and infinitesimals of infinite orders; but have distinguished even nothings into various kinds!—and if such liberties continue, it is not easy to foresee what absurdities may be advanced as discoveries in what is called the SUBLIME GEOMETRY.”—“PHILOSOPHY probably will always have it’s mysteries; but these are to be avoided in GEOMETRY, [as far as is possible, and as much as in us lieth]; and we ought to guard against abating from it’s strictness and evidence the rather, that an ABSURD PHILOSOPHY is the natural product of a VITIATED GEOMETRY.”

46. “Sir ISAAC NEWTON accomplished what CAVALERIUS had wished for, [and avoided the rock on which the daring Leibnitz had split] by inventing the Method of Fluxions; and proposing it in a way that admits of strict demonstration: which requires the supposition of no quantities but such as are finite, and easily conceived. The computations in this method are the same as in the Method of Infinitesimals; but it is founded on accurate principles agreeable to the ANCIENT GEOMETRY: In it, the premisses and conclusions are equally accurate; no quantities are rejected as infinitely small\*, and no part of a curve is supposed to coincide with a right line. The excellency of this method has not been so fully described, or so generally attended to, as it seems to deserve; and it has been sometimes represented as on a level, in all these respects, with the Method of Infinitesimals. The chief design of this treatise, is to shew it’s advantages in a clearer and fuller light, and to promote the design of the great inventor, by

\* Compare Newton’s Demonstration of the Fluxion of a Rectangle, § 84, 85, with Euler’s, derived from the Infinitesimal Method, § 87, to which it is infinitely superior in accuracy and elegance.

establisshing

establishing the HIGHER GEOMETRY on plain principles, perfectly consistent with each other, and with those of the *ancient Geometricians*."—*Maclaurin's Introduction to Fluxions*.

---

*De Applicatione Methodi Rationum Primarum et Ultimarum seu Limitum, ad Quadraturam Curvarum, atque ad Mechanicam Rationalem.*

---

47. Hujus applicationis elegantia quædam proferuntur exempla à *Newtono* in *Lemmatibus insequentibus*: LEM. II. et III. Si polygonorum rectilineorum figuræ cuiusvis curvilineæ similiter inscriptorum et circumscriptorum augeatur numerus laterum correspondentium, et diminuatur magnitudo in infinitum, ita ut differentia polygoni inscripti et circumscripti tandem fiat minor quavis datâ: ultimæ rationes quas habent polygonum inscriptum et circumscriptum, ad se invicem, (et multò magis ad figuram curvilineam intermediam) erunt rationes æqualitatis.

Immediatè et nullo negotio sequitur hoc, ex *Lemmate primo* fundamentali; idque sive polygonorum latera sint æqualia, ut in *Lemmate secundo*; sive inæqualia, ut in *Lemmate tertio*.

*Cor. 1.* Hinc polygonæ inscriptæ et circumscriptæ, tandem evanescente differentia, ultimè coincident omni ex parte, cum figurâ curvilineâ.

*Cor. 2.* Et propterea, polygonæ ultima, quoad perimetros suos, non sunt rectilineæ, sed rectilineorum limites curvilinei.

48. Atqui hæc est ipsa *Methodus Exhaustionum* quam exercebant *Geometriæ veteres*, in compendium redacta, et longè promota, ab hoc artifice summo; sicut luculentius ostenditur in *Introductione Maclauriniana*:

"The *Method of Exhaustions* was that by which the Ancients demonstrated all their theorems for measuring and comparing *curvilinear* figures. It is often said that *curve lines* have been considered by them as *polygons of an infinite number of sides*; but this principle no-where appears in their writings: we never find them resolving any figure or solid into *infinitely small elements*: on the contrary, they seemed to avoid such suppositions; as if they judged them *unfit* to be received into GEOMETRY, when it was obvious that their demonstrations might have been sometimes *abridged* by admitting them."

"They considered *curvilinear areas* as the *limits* of circumscribed or inscribed figures of a more simple kind, which approach to these limits (by a bisection of lines

lines or angles that is continued at pleasure); so that the difference betwixt them may become less than any given quantity: The inscribed or circumscribed figures were always conceived to be of a number and magnitude that is assignable; and from what had been shewn of these figures, they demonstrated the mensuration or the proportions of the *curvilinear limits themselves*, by arguments *ab absurdo*. They had made frequent use of demonstrations of this kind from the beginning of the ELEMENTS [as where the affections of *similar polygons*, found in the first six books, are transferred to *circles* in the twelfth book.] And these are in a particular manner adapted for making a transition from *right-lined* figures to such as are bounded by *curve lines*. By admitting them only, they established the more difficult and sublime parts of their *Geometry*, on the same foundation as the first elements of the science. Nor could they have proposed to themselves a more perfect model."

49. "We have already observed how solicitous *Archimedes* appears to be, that his demonstrations should be found to depend on those principles only that had been *universally received* before his time. In his Treatise of the *Quadrature of the Parabola*, he treats of a progression whose terms decrease constantly in the proportion of 4 to 1 (which we expressed by the trapezia  $CDba$ ,  $DGcb$ ,  $GRdc$ ); but he does not suppose this progression to be continued to infinity; or mention the sum of an infinite number of terms; though it is manifest, that all which can be understood by those who assign that sum, was fully known to him. He contented himself with demonstrating this plain property of such a progression: That the sums of the terms continued at pleasure, added to the third part of the last term, amount always to four-thirds of the first term: (as, for instance, in the *Quadrature of the Parabola*, *Introduct.* p. 27—29. Pl. 3. Fig. 13. the sum of the trapezia  $CDba$ ,  $DGcb$ ,  $GRdc$ , added to one-third part of the last trapezium  $GRdc$ , amounts always to four-thirds of the first trapezium  $CRda$ , or to it's limit, the triangle  $CAa$ ;) but while this first trapezium approaches continually to it's limit, the inscribed polygon at the same time is approaching to the *parabolic* segment it's limit; and these are equal to each other, as there demonstrated; or in *Hamilton's Conic Sections*, (*De Quadratura Parabola*, according to *Archimedes*.)—After all the methods that have been proposed for demonstrating the *Quadrature of the Parabola*, this of the inventor himself seems to have a particular accuracy and elegance: he does not suppose the chords of the curve to be bisected to infinity; so that, after an infinite bisection, the inscribed polygon might be said to coincide with the parabola. These suppositions had been new to the geometers in his time; and such he appears to have avoided carefully.—On this occasion, he shews how to find the sum of any number of terms that decrease constantly in the proportion of four to one: and by this example of a *geometrical progression*, (as it is commonly called,) opened up a subject, which has been treated at great length by the modern geometers."

50. "But

50. "But even *Archimedes* himself has not escaped the censures of some writers, *Hobbes*, *Joseph Scaliger*, &c. who, being *unskilful* in Geometry, and *unable to reconcile their own conceits with his demonstrations*, have represented him as in an error, and "misleading mathematicians by his authority."—*Plutarch*, however, celebrates the *simplicity* and *plainness* with which he treats the most difficult and abstruse questions :

Ου γὰρ ἔστιν ἐν Γεωμετρίας χαλεπωτέρας καὶ βαρυτέρας ὑποθέσεις ἐν ἀπλῶσερις λαβεῖν καὶ καθαρωτέροις στοιχείοις γραφομένας.

"For it is impossible to find more difficult and weighty subjects written in simpler and purer elements."

"He appears indeed to have been more fond of preserving to the science all it's accuracy and evidence, than of advancing paradoxes."

"And although the pursuit of *general* and *easy* methods may have induced some moderns to make use of *exceptionable* principles, and the vast extent which the science has of late acquired, may have occasioned their proposing incomplete demonstrations, yet the *first essays* were deduced from a careful attention to his steps — "C'étoit en observant de près la marche d'ARCHIMEDE, qu'il (M. De Roberval) étoit arrivé à cette sublime et merveilleuse science."—*Acad. Scient.* an. 1693.—This is generally acknowledged by the writers of that time."

51. "Hence it was with caution that the Doctrine of *Indivisibles* was at first employed in Geometry by *Cavalieri*; therefore he subjoined more *unexceptionable* demonstrations to those he had deduced from his own principles: and the disputes which ensued (the first of any moment that were known between *geometricians*) justified his precautions."

52. "Geometricians of the first rank had recourse to this method of *limits* long ago, on several occasions, as a method of the strictest kind: M. de *Fermat*, in a letter to *Gassendi*, and M. *Huygens*, in his *Horologium Oscillatorium*, have employed it for completing the demonstrations of some theorems that were proposed by *Galileo*, and proved by him in a less accurate manner; and Dr. *Barrow* has demonstrated by it a theorem concerning the *Tangents of Curve Lines*."

53. In *Quarta Lemmate* demonstrat *Newtonus rationes limitum curvilinearum, ultimum esse easdem ac polygonorum inscriptorum.*

Nam ut partes singulae polygonorum inscriptorum ad singulas, ita (componendo) fit summa omnium ad summam omnium; et proinde (per Lem. 3. Cor. 2. præced.) limes curvilineus ad limitem curvilineum. Q. E. D.

Cor. Hinc, si due cujuscunque generis quantitates, in eundem partium numerum utcunque dividantur; et partes illæ, ubi numerus earum augetur et magnitudo diminuitur

diminuitur in infinitum; *datam obtineant ad invicem rationem*, prima ad primam, secunda ad secundam, cæteræque suo ordine ad cæteras: erunt *tota* ad invicem *in eadem illâ datâ ratione*. Nam, si sumantur tota inter se ut partes, erit totum prius ad summam partium, et totum posterius ad summam partium, in ratione æqualitatis; et proindè, per hypothesin, in ultima ratione partis ad partem.

Q. E. D.

§4. Ope hujus principii generalissimi, tam GEOMETRIAM quàm ALGEBRAM permeantis, emendare licet demonstrationem *Tacquetianam*, Prop. 1. Lib. 6. El. Nempè "*triangula æqualia, &c. esse ad invicem in ultimâ ratione basium*;" quæ deficit, ubi de *incommensurabilibus* agitur; cum "*indiciu proportionis*" pro *Euclideo* malè substitutum à *Tacquet*, *commensurabilibus* tantum restringitur.

Sumptis partibus similibus DEG et DG trianguli prioris DEF, et basis prioris DF; si substituantur hæ partes in triangulum posterius ABC et basin posteriorem AC respectivè, quoties fieri potest; ubi numerus partium augetur et magnitudo diminuitur in infinitum, ultimò *datam obtinebunt ad invicem rationem*: et proindè, erunt *tota* ad invicem *in eadem illâ datâ ratione*: hoc est, erit triangulum prius DEF ad posterius ABC, ut basis prior DF ad posteriorem AC.

Q. E. D.

§5. Quàm iniquæ igitur sunt in *Newtonum* criminationes, quasi "*methodum recentem*," "*veteribus ignotam*," "*alienis principiis fundatam*, à doctrinâ *motus* translatis," iisdemque "*minimè necessariis*" excogitasset!—Pudet equidem tales cavillationes unquam admisisse analytæ ex peritissimis *Landen*, *D'Alembert*, et *Censuræ* illum *Professorium*, præ incuriâ et oscitantia saltè, si non ex invidia oriundas. Maximè autem pudet viri clarissimi *De La Grange*:—nonne *dormitat bonus*, ubi profitetur "*se traditurum functionum analyticarum theoriâ*, ab omni consideratione *limitum* immunem!"—(si fides habenda sit isti *Censori* apud THE MONTHLY REVIEW.)

*Dic quibus in terris—*

*—et eris mihi magnus Apollo!*

§6. Atqui luce clariùs constat, ex his documentis, principia infirma et vacillantia *methodi differentialis*, quæ primò posuerat *Leibnitz*, ex notionibus suis vagis et incongruis de *infinitesimis*, (seu quantitativis infinitè parvis) gradatim et lentè purgasse, et tacitè, discipulos suos; atque ad *Newtonianam veritatem*, atque *rigorem Geometricum*, tandem et quasi proprio jure, perfecisse: nunc verò reclamare audent ingrati, debito suo honore *Newtonum*, successorem dignum veterum analytarum, *Archimedis*, *Apollonii* et *Euclidis*, iniquissimè defraudantes!

§7. Demonstrat *Euclides*, Prop. 20. Lib. 6. El. quod "*Polygonorum similium latera omnia quæ sibi mutuo respondent sunt proportionalia*, et, 2. *Aræ sunt in duplicatâ ratione laterum*:" hanc proprietatem insignem ad *circulum* transtulit

B

*Archimedes*;

*Archimedes*; et ipse *Euclides* in *Prop. 2. Lib. 12. El.* Et generaliter, extendit *Newtonus* ad *curvas quascunque*, in *Lemmate quinto*; eodem ratiocinio posito, idque, sive *latera* sint *curvilinea*, sive *retilinea*.

58. In *Lemmate septimo*, demonstrat *Newtonus*, (per evanescentiam anguli contactus, *Lem. 6.*) quod *ultima ratio arcus quam minimi, chordæ et tangentis est ratio æqualitatis*; pariterque *semiarctus, ordinatæ et abscissæ tangentis*; vel *chordæ semiarctus, ordinatæ, &c.* Et propterea hæ omnes lineæ in omni de *rationibus ultimis* argumentatione pro se invicem usurpari possunt.

59. In *Lemmate octavo*, quod *ultima forma triangulorum evanescentium*, (ubi ex rectis à centro quodam quasi vertice, ad basin productis, sive hæc basis, sit vel arcus, vel chorda vel tangens, fiunt hæc triangula) *est similitudinis*, et *ultima ratio æqualitatis*. Et hinc *triangula illa* in omni de *rationibus ultimis* argumentatione pro se invicem usurpari possunt.

60. In *Lemmate nono*, demonstrat (per *Lem. quintum*), quod *area triangulorum curvilineorum similium* ex curvarum tangentibus seu secantibus, et ordinatis seu subtentis externis angulorum contactus factorum, *erunt ultimò ad invicem in duplicatâ ratione laterum*.

61. Elegantissimâ translatione factâ ad *Mechanicam Rationalem*, in *Lemmate decimo* demonstrat, quod *si corpus, urgente vi quâcunque finitâ, moveatur*; sive, 1. *vis illa determinata et immutabilis sit*; sive, 2. *eadem continuò augeatur vel continuò diminuatur*; *erunt spatia ipso motûs initio in duplicatâ ratione temporum*.

Nam, si *tempora* motûs exponantur per *abscissas*, et *velocitates genitæ* per *ordinatas externas*, (seu subtentas angulorum contactus) spatia, hæc vi urgente, descripta ritè exponentur per *areas triangulares* curvilineas hîsce ordinatis descriptas; et proinde (per *Lem. 5 et 9.*), erunt in duplicatâ ratione laterum correspondentium, h. e. *abscissarum* seu *temporum*.

*Cor. 1.* Et quoniam virium diversarum intensitates ritè exponuntur per *velocitates* quas generant, erunt hæ vires, ut *spatia*, ipso motûs initio descripta directè et *quadrata temporum* inversè; per *Prop. 23. Lib. 6. El.*

62. In *Lemmate undecimo* demonstrat *Newtonus*, quod *ordinata externa* (seu *subtensa evanescens anguli contactus*) in *curvis omnibus curvaturam finitam ad punctum contactus habentibus*, *est ultimò in ratione duplicatâ chordæ arcus contermini*.

Nam, ex naturâ *circulorum æquicurvorum*, circâ has areas triangulares descriptorum, erunt *ordinatæ externæ*, seu *circulorum sagittæ*, his proportionales, ut *quadrata chordarum* arcuum conterminorum directè, et *diametri* circulorum inversè; sed, *ultima ratio diametrorum*, evanescente differentiâ, sit ratio æqualitatis; adeoque *ordinatæ externæ* erunt ut *quadrata chordarum*.

E

*Cor. 1.*

*Cor. 1.* Hinc, *sagittæ curvarum* quoque, quæ *chordas arcuum duplorum* bisecant, et ad datum centrum motûs convergunt, *sunt etiâ ultimò ut quadrata arcuum conterminorum.* Nam *sagittæ illæ* sunt ut *ordinate externæ*, et *arcus* cum *chordis* ultimò coincident, per *Lem. 7.*

*Cor. 2.* Ideoque *sagittæ illæ* sunt in *duplicatâ ratione temporum* quibus corpus datâ *velocitate* describit *arcus quam minimos.* Nam datâ *velocitate*, hi *arcus* sunt ut *tempora*; et proindè *quadrata arcuum* ut *quadrata temporum.*

63. Atque sunt hæc *principia mathematica generalissima*, quorum ope demonstrat *Newtonus* in sequentibus propositionibus, *Seç. 11. rationes virium centripetarum* ad invicem; *legeque* secundum quas corpora circa commune centrum motûs revolvuntur, accelerantur aut retardantur pro diversis à centro distantis. Vide § 88, 89 et 103.

### De Fluxionum Elementis Primis.

64. Quo magis pateat hujûsce Methodi, sive *Fluxionalis* sive *Differentialis*, evidentia et certitudo, visum est "*fundamentum* totius methodi" inspicere et perscrutari, quale illud struxit artifex ille egregius in *Lemmate secundo Lib. 2. Princip.* ulteriusque obiter exposuit, in *Analysi per Series Numerorum Infinitas*, atque in *Quadraturâ Curvarum*;—quæ tria opera "*chordam triplicem baud facillè disfrangendam*" constituunt, vel viribus obtrectatorum *Britannorum* vel *Gallorum*, vel aliorum quorumvis contrâ hanc doctrinam infauitè combinatorum.

65. Terminos fluxionum *technicos* scitè definit *Newtonus*, et expositione satis dilucidâ distinguit:

1. "*Genitam* voco, quantitatem omnem quæ ex lateribus vel terminis quibuscunque, in *ARITHMETICA* per multiplicationem, divisionem et extractionem radicum; in *GEOMETRIA*, per inventionem vel contentorum et laterum, vel extremarum et mediarum proportionalium, sine additione et subductione generantur: ejusmodi quantitates sunt *facti*, *quoti*, *radices*; *rectangula*, *quadrata*, *cubi*, *latera quadrata*, *latera cubica*, et similes. Has quantitates, ut *indeterminatas* et instabiles, et *quasi motu fluxive perpetuo* crescentes vel decrecentes, hîc considero: et

2. "*Earum incrementa* vel decrementa momentanea, sub nomine *momentorum* intelligo; ita ut *Incrementa*, pro *momentis additiis* seu *affirmativis*; ac *Decrementa*, pro *subductiis* seu *negativis*, habeantur.

66. "Cave tamen intellexeris [sub nomine *momentorum*] *particulas finitas* : *particulæ finitæ* non sunt *momenta*, sed *quantitates ipsæ* ex momentis genitæ ; [per vocem *momenta*] intelligenda sunt *principia jamjam nascentia* finitarum magnitudinum. Neque enim spectatur in hoc lemmate *magnitudo* momentorum, sed *prima nascentium proportio*."

Idem quoque fusiùs exponit in *Analysi per Æquationes* ; doctissimo Colson ita Anglicè eam reddente :

"The *moments* of *flowing* quantities are their *indefinitely small* parts, by the accessions of which, in *indefinitely small portions of time*, they are continually increased."

3. "Now these quantities, which I consider as gradually and indefinitely increasing, I shall hereafter call *Fluents*, or flowing quantities."

67. 4. "Whereas only quantities of *the same kind* can be compared together, and also their *velocities* [or *rates*] of increase or decrease ; therefore, in what follows, I shall have no regard to *time*, formally considered ; but I shall suppose *some one* of the quantities proposed (being of the same kind) to be increased by an *equable* quantity, to which *the rest* may be referred, *as it were*, to *time* : and therefore, by way of *analogy*, it may not improperly receive the name of *Time*. When, therefore, the word *time* occurs in what follows, (which, for the sake of *perspicuity* and *distinction*, I have sometimes used,) by that word, I would not have it understood as if I meant time in its *formal* acceptation, but only that *other quantity*, by the equable increase or flux whereof time is *expounded* and *measured*."

68. 5. "Eodem recidit, si loco *momentorum* [ipsorum,] usurpentur vel *velocitates* incrementorum ac decrementorum, (quas etià, "*motûs mutationes*," et "*fluxiones* quantitatum," nominare licet,) vel *finita quævis quantitates*, *velocitatibus hisce proportionales*."

Et paritèr quoque, scribit *Newtonus* in *Quadraturâ Curvarum* :—" *Fluxiones* sunt quàm proximè ut fluentium *augmenta æqualibus temporibus quàm minimis genita* ; et, ut accuratè loquar, sunt in *primâ ratione momentorum nascentium*."

And again, in the *Analysis* :—"The *moments* of flowing quantities—are as the *velocities* [or *rates*] of their flowing or increasing ;"—"and the *velocities* [or *rates*] by which every fluent is increased, by it's generating motion [whatever that may be], I may call *Fluxions* ; or simply, *Velocities* or *Celerities*."

69. Ex his documentis undique congestis et intertextis, luculentissimè constat, quantâ peritiâ, sollicitudine et cautione, methodi suæ generalis fundamentum posuit *Newtonus*, in *definitionibus*, *distinctionibusque* accuratissimis ; "*perspicuitatis*" (ut ipse dicit) quàm maximè studiosus, in re longè difficillimâ et subti-

lissimâ. Abundè autem liquet, eum usurpâsse vocem “*velocities*,” (quæ tantas tragœdias excitavit), in latiore sensu, pro *rationibus* crescendi vel decrescendi—“*rates of increase or decrease*.”—Et inde sensu generalissimo definiri possunt *fluxiones*—*Mensuræ quævis rationum secundum quas quantitates fluentes quælibet ejusdem generis, quolibet in statu mutationis, utcunque variantur.*

70. Quidni autem eadem licentia *Newtono* concedatur, quam sibi sumebant *Analystæ veteres*? Cur non, æquo saltèm jure, *Newtono* fas fuerit, in rebus geometricis principium geometricum adhibere, et “*genitas*” quascunque quantitates, ex fluxu, seu “*quasi motu perpetuo*,” oriundas, considerare; quàm *Archimedi*, *Apolloni*, et *Euclidi*, concipiendi *lineam* quasi ex motu *puncti*, *superficiem*, quasi ex motu parallelo *lineæ*, et *solidum*, quasi ex motu parallelo *superfici*, respectivè genita? Idque, illis *strandi* gratiâ, nimirum, in rebus *metaphysicis* à sensibilibus valdè abstractis? Nonne GEOMETRIA ipsa, exiguos fines *definitionis nominis* aspernans, longè, imò longissimè, ultrà “*mensurationem terræ, sive agrorum*,”—“*land-surveying*”—in remotissimas cœlorum regiones, ultrà orbem *planetarum*, *cometarum* atque *astrorum*, ad ipsam *viam lacteam* excurrit—træni impatiens, “*nec audit habenas*?” Et quidni vocabulum “*fluxio*,” quoque, in sensu latissimo atque amplissimo, ad omnigenas *functiones*, MECHANICÆ RATIONALIS,—*vires*, *pondera*, *densitates*, *resistentias*, *reflexiones*, *refractiones*, *infractiones*, *aberrationes*, &c. seu quascunque quantitatum mutationes, secundum magnitudines et directiones, ritè exponendas, extendatur et ampliatur?—De *definitionibus nominum* disputare, (non *κατὰ φύσιν* seu “*secundum rei ipsius naturam*,” sed *κατὰ θεον*, “*pro definitæ arbitrio*”—vel *instituto*)—pusilli est ingenii, *minutique philosophi*.—Eodem redeunt *Fluxiones NEWTONI* et *Functiones DE LA GRANGE*; ut ex definitione vocis posterioris, apud THE MONTHLY REVIEW, constabit:

71. “A *function* of one or more quantities, is every expression in which these quantities enter after any manner whatever (combined, or not, with other quantities of given or variable values), while the quantities of the *function* may receive all possible values.”

72. Eodem quoque recidit *Methodus Differentialis*, (definiente *analystâ* peritissimo, *Euler*, in suis *Institutionibus*) ac ipsa *Fluxionalis*:

“*Methodus determinandi rationem incrementorum evanescentium, quæ functiones quæcunque accipiunt; dum quantitati variabili cujus sunt functiones, incrementum evanescens tribuitur.*”

Velut si quantitatis variabilis  $x$ , incrementum sit  $i$ ; ubi hæc quantitas sit  $x + i$ , fiet hujus quadratum,  $x^2 + 2xi + i^2$ . Erit igitur

$$\text{Increm. } x : \text{increm. } x^2 :: i : 2xi + i^2;$$

$$\text{vel, dividendo per } i, \text{ —} :: 1 : 2x + i.$$

Et

Et proinde ratio 1 ad  $2x$ , exponet rationem incrementi lateris variabilis  $x$  ad incrementum quadrati variabilis  $x^2$ , ipso in *limite*, ubi  $i$  evanescit, accuratè; antequàm evanescit, quàm proximè tantùm. At *limes rationis horum incrementorum evanescentium* solummodò in *Calculo Differentiali*, *Eulero* iudice, spectatur.

73. Quis non videt analysta benè cordatus, ad amussim quadrare Methodum *Fluxionalem* cum *Methodo Differentiali*, tam *Euleri* quàm *De La Grange*?—et methodo utrique æquè competere considerationem *temporis* inter crescendum decrescendumve elapsi?—si non “*formalitè*” quidem, saltèm per *analogiam*, sive per *accommodationem*, et illustrandi gratiâ?—et quale aut quantum intercedat discrimen (intelligo verum discrimen, non nomini tenùs) inter “*momenta*” *Newtoni*, et “*incrementa evanescentia*” *Euleri*, detegat, oro, analystarum vel perspicacissimorum curiosa felicitas, in sæcula sæculorum.

74. Non idcirco nisi imperitè objicientis est “*animadversio docti Torelli*,” quam commendat M. R. quasi—*inter exempla admodum perspicue validæque argumentationis*” annumerandam:

“*Neque verò quidquam agunt, qui, infinitesimas quantitates rejicientes, momenta quædam earum loco GEOMETRIÆ inferunt; eaque ita vocant, quod concipiuntur momento temporis finitæ magnitudinis fluxu oriri: Si enim momenta hæc vires suas fluendo explicant, non aliud sunt quàm ipsæ quas rejiciunt infinitesimæ quantitates; sin autem nituntur neque tamen ultrà tendunt, novum vocabulum frustra inducitur, dum id quod nihil est momentum appellatur.*”

At ruit objectio suis viribus everfa. Nam, 1. *momentum* non est *nihil*, ut ex definitione constat; nec, 2. est *infinitesima quantitas*, cum *magnitudinis finitæ*, seu determinatæ, (licet quàm *minimæ*) esse concipiatur; nam, ut accuratissimè loquitur *Newtonus*, est “*augmentum fluentis tempore quàm minimo genitum*,” neque, 3. si valida sit, minùs hostilitèr in *Methodum Differentialem*, quàm *Fluxionalem*, invehitur, iisdem principiis innixas; totius analyteos sublimioris fundamentum æquè labefactando.

75. Nec minùs ruit altera ista objectio *D'Alembert* ( $f$ ), in vocem “*Velsciatatem*” animadvertentis, quippè quæ eodem redit in sensu *Algebræico*, ac “*ratio*.”

( $f$ ) “To speak of *D'Alembert* merely as a mathematician,” THE MONTHLY REVIEW seems rather to over-rate his merits:—However profound his researches, and extensive his labours “to clear away the rubbish of jargon and mystery from science,” his calculations and demonstrations are exceedingly rugged, prolix and intricate; far removed from the elegance, conciseness and arrangement of *Newton*, and even of *Euler* and *Clairaut*.—When *Landen* (himself a profound mathematician, and who first discovered the source of *Newton's* mistake, in determining the quantity of the precession of the equinoxes, the merit of which is attributed to *D'Alembert* by the M. R.) had examined *D'Alembert's* solution of the *Theory of Rotatory Motion*, differing from his own, he was unable to discover the source of that difference in the obscurity of his argument, until assisted by the perspicuity of *Euler's* manner; whose solution agreed in it's result with *D'Alembert's*.—And surely his objection to the Method of Fluxions shows that he was not deeply versed in the metaphysique of the science.

et in sensu *Geometrico*, legitimè pro *fluxione* usurpanda est, cum *velocitas* sit “*exponens rationis*” inter spatium et tempus intercedentis, ubi motus sit uniformis; et proinde *relationem* verè existentem inter veras quantitates commensurabiles in *Mechanicâ Rationali*, aptè, et “*naturalitèr* quidem,” (ipso fatente M. R. p. 498.) designat. Et secundùm *D'Alembert—Calculi Differentialis* in *Geometricis*, munus est—“*déterminer algèbraïquement LA LIMITE d'un rapport de laquelle on à déjà l'expression en lignes; et à égaler ces deux limites; ce qui fait trouver une des lignes qu'on cherche.*”

Atque illustrandi gratiâ, ductâ tangente *parabole*, cujus æquatio est  $ax = y^2$ , primò exquirat *D'Alembert* valorem unius limitis algebræicè,  $(\frac{a}{2y})$ ; et valorem alterius geometricè  $(\frac{y}{x})$ ; quibus æquatis, deducit valorem *subtangents*,  $(s) = \frac{2y^2}{a} = 2x$ . Atque agnoscit paritèr, (ut, ex abundanti diluatur objectio *Torelliana*) quòd in formulâ  $\frac{dx}{dz}$ , secundùm notationem differentialem, seu  $\frac{\dot{x}}{\dot{z}}$  secundùm fluxionalem),  $dx$  et  $dz$  (seu  $\dot{x}$  et  $\dot{z}$ ) non designare *quantitates infinitesimas*, seu infinitè parvas, sed in certo quodam statu *finite magnitudinis*; tales enim *symbolicè* tantùm usurpari pro formâ loquendi compendiosâ, calculis concinnandis accommodatâ, verùm nullatenus *criticè*, seu pro *usu philosophico* terminorum technicorum.

76. Atque hoc pacto, ipse quoque *Censor*, p. 487, monet, quòd si *curvæ* *cujusdam axis* denotet *tempus* descriptionis; et *ordinatim applicatæ* quibusvis *curvæ* ipsius punctis, *spatia* (vel actu descripta vel quæ describenda forent *velocitate* exinde uniformitèr continuatâ); erit *velocitas* ubivis, ut *quotiens ordinatæ per subtangentem divisæ*, seu  $v = \frac{o}{s}$ ; et proinde per hanc rationem verè exponitur seu mensuratur.

77. Haftenùs explicatis elementis primis *Methodi Fluxionum*, pro suâ subtilitate fusiùs; facilitati conceptûs consulens, et speculationibus *metaphysicis* facem præbens, quantum res difficillima pateretur; et absolutis *vindictis* advertit obtrectatores laudum *Newtonianarum*, tam exteros quàm nostrates; gratiam ut spero, promeriturus *omnium* cordatiorum analyistarum, qui quantum *Newtono* debent agnoscere haud gravantur; (*Anglorum* potissimùm, ingens illud decus *BRITANNIÆ*, atque *Analyseos* sublimioris principem et architectum, optimo jure admirantium): Superest ut ipsius *methodi generalis rudimenta* proponam; pressiùs atque concinnius, et tamen uberiùs ac luculentiùs, quàm alii

alii scriptores qui hactenùs hoc facere aggressi sunt, hâc, nimirum, lege mihi propositâ et sedulò observatâ, ut vestigiis ipsius inventoris sagacissimi, quàm maximè potuerim, fidelitèr semper infisterem ;

*Te sequor, O MAGNÆ GENTIS DECUS ! inque tuis nunc  
 Fixa pedum pono pressis vestigia signis ;  
 Non ita certandi cupidus, quàm propter amorem,  
 Quid te imitari aveau:—  
 E tenebris tantis tam clarum extollere lumen  
 Qui primus potuisti, illustrans commoda vitæ.—  
 Tu PATER ! ET RERUM INVENTOR !—  
 ———Tuisque ex, INCLUTE, chartis,  
 Floriferis ut APES in saltibus omnia libant,  
 Omnia NOS itidem depascimur aurea dicta,  
 Aurea, perpetuâ semper dignissima vitâ.*

LUCRETIVS.

Nam æquum certè erit has laudes ad *Newtonum* transferre, VIRTUTIS VERÆ custodem, SAPIENTIÆ rigidum satellitem, quas de *Epicuro*, “*insanientis sapientia*” patre et “*patrono*” falsò prædicat *Lucretius* ; qui ipse, vitæ pertæsus, non ultrà quadragesimum ætatis annum proventus, necem sibi conscivit,

MISERÆ PHILOSOPHIÆ MISERUM SOLAMEN !

# ANALYSIS FLUXIONUM.

---

## PARS SECUNDA.

---

### DEFINITIONES.

§ 78. 1. *METHODUS Fluxionum* est quæ determinat quantitatum ejusdem generis, utcunque variabilium, rationes ad se invicem, quolibet in statu contemporaneo variationis seu mutationis, per *methodum primarum et ultimarum rationum* seu *limitum*.

2. *Rationes ultimæ* sunt *limites*, ad quos quantitatum sine fine decrefcentium rationes, 1, *semper appropinquant*; et, 2, quas *propius assequi* possunt quàm pro datâ quâvis differentiâ; 3, *nunquam verò transgredi*; 4, *nec prius attingere*, quàm quantitates ipsæ diminuuntur in infinitum. Et par est natura *rationum primarum*.

3. *Fluens* est quantitas ipsa variabilis, sed tamen finita, quemvis mutationis statum subiens, antequam evanescat, seu in infinitum augeatur.

4. *Genita* est ipsius fluentis magnitudo *certo* quodam variationis puncti, seu mutationis statu.

5. *Momentum* est fluentis augmentum aut decrementum *momentaneum*; id est, tempore quâ minimo genitum. Estque *fluxioni* proportionale.

6. *Fluxio*, seu *Functio Analytica*, seu *Differentialis*, est *mensura quævis rationis secundum quam variatur fluens*, quolibet in statu mutationis.

7. Fluentis ipsius *Fluxio* appellatur *prima*, seu *primi ordinis*; hujus iterum *fluxio* (si prima fluxio variabilis sit) *secunda*, seu *secundi ordinis*; (si secunda quoque sit variabilis,) hujus denuò *fluxio*, *tertia*, seu *terti ordinis*; atque ita deinceps, donec ultimò perveniatur ad *fluxionem constantem*, seu mutatione uniformi procedentem.

8. *Methodus Fluxionum Directa*, quæ ex fluentibus datis invenit fluxiones; *Methodus Inversa*, vicissim, ex fluxionibus datis invenit fluentes.

9. *Æquatio Fluctualis seu Integrans*, quæ ex fluentibus solis constat; *Æquatio Fluxionalis seu Differentialis*, quæ fluxiones fluentibus immixtas continet.

### AXIOMATA.

79. 1. *Quantitates*, ut et *Quantitatum Rationes*, quæ sunt *constantes* aut *datae*, nullas sortiuntur fluxiones.

2. *Quantitatum* vel *Rationum* in *maximis* aut *minimis* versantium, vel in *limitibus* ipsis, evanescent fluxiones.

3. *Fluxio summa* duarum pluriúmve fluentium æquatur *summa fluxionum* singularum fluentium cum propriis signis; scilicet, affirmativis, si momenta pro incrementis habeantur; negativis, si pro decrementis.

4. *Quantitates* quæ *constanter*, seu *æquabiliter*, seu *certâ et determinatâ quâdam ratione* fluunt, fluxiones tantum *primas* sortiuntur.

5. Fluxio cujusvis fluentis sive puræ, sive cum cognitis quibuscunque quantitatibus immixtæ, est eadem. Sic, si  $A$  sit quantitas variabilis, et  $e$  quantitas data, quantitatibus  $A$  et  $A \pm e$  eadem erit fluxio  $a$ .

6. Eadem fluens *plures* sortiatur fluxiones; si modo sint in datâ ad invicem

ratione. Sic quantitatibus  $A^{\frac{m}{n}}$ , cujus prima fluxio est  $\frac{m}{n} a A^{\frac{m}{n}-1}$ , secunda erit

$$\frac{m}{n} \cdot \frac{m}{n} - 1 a^2 A^{\frac{m}{n}-2}; \text{ vel huic proportionalis, } \frac{m}{n} \cdot \frac{m}{n} - 1 a^2 A^{\frac{m}{n}-2};$$

nempè, in ratione datâ 1 ad  $\frac{1}{2}$ .

Pauca insuper, *preparationis* loco, subungere libet de *variis formis notationi* quæ in calculo sive fluxionali sive differentiali adhiberi solent.

*De Notatione Fluxionali.*

80. *Fluentes* primò designabat *Newtonus*, in *Lem. II. Lib. II. Princip.* per literas majusculas A, B, C, &c. Et harum *momenta*, (seu *fluxiones* momentis proportionales), per minuscultas a, b, c, &c.; quæ relationes quantitatum ipsarum respectu magnitudinis benè exponunt. Postèa verò, alteram illam methodum, jam usitatiorè, excogitavit, designandi fluentes per minuscultas x, y, z, &c. harumque fluxiones diversorum ordinum per puncta super-imposita, hoc modo :

$\dot{x}$ , $\dot{y}$ , $\dot{z}$	&c	- - -	<i>fluxiones prima,</i>
$\ddot{x}$ , $\ddot{y}$ , $\ddot{z}$	&c	- - -	<i>fluxiones secunda,</i>
$\dddot{x}$ , $\dddot{y}$ , $\dddot{z}$	&c	- - -	<i>fluxiones tertia,</i>
$\ddddot{x}$ , $\ddddot{y}$ , $\ddddot{z}$	&c	- - -	<i>fluxiones quarta.</i>

81. Secundùm notationem differentialem, minùs elegantèr exponuntur *differentiales* uniuscujusque gradus,

$dx$ (seu $x^i$ ),	-	<i>differentialis prima,</i>
$ddx$ ,	- - -	<i>differentialis secunda,</i>
$ddd x$ ,	- - -	<i>differentialis tertia,</i>
$dddd x$ ,	- - -	<i>differentialis quarta.</i>

Secundùm notationem quam usurpat *De La Grange*, si curvæ cujusvis æquatio sit  $y = f x$ , erunt valores, *subnormalis*, *subtangents* et *radii curvaturæ*  $yy'$ ,  $\frac{y}{y'}$ , et  $\frac{(1 + y'^2)^{\frac{3}{2}}}{y'}$ , respectivè, quæ secundùm notationem Newtonianam produnt  $\frac{yy'}{x}$ ,  $\frac{yx}{y}$ , et  $\frac{(x^2 + y^2)^{\frac{3}{2}}}{xy}$ .—*Censore* referente.

In *tertiâ editione Princip.* p. 486, designat quoque *Newtonus differentias primas* per b, 2b; *secundas*, per c, 2c; *tercias*, per d, 2d, &c.

82. Ingenti autèm Matheseos commodo, introduxit *Newtonus* in *Algebram Speciosam* notationem *indicum fractionum* et *negativorum*; quarum rationem breviter exponere in animo est, ne confundantur tyrones notatione inusitata; præsertim,

præfertim, cùm non defint auctores, qui usum indicum *fractionum* et *negativorum* pravâ confusione miscent.

Indices *integros* quantitatum  $A^2, A^3, A^4, A^m$ , indicant varias *potestates* seu dignitates, per *involutionem* resultantes. Indices *fractioni*  $A^{\frac{1}{2}}, A^{\frac{1}{3}}, A^{\frac{1}{4}}, A^{\frac{1}{n}}$ , varias itidem *radices*, per evolutionem; quales nempè referunt *surda* quantitates, secundùm notationem vulgarem,  $\sqrt{A}, \sqrt[3]{A}, \sqrt[4]{A}, \sqrt[n]{A}$ . Ex utriusque autem combinatione, emergent  $A^{\frac{1}{2}}, A^{\frac{1}{3}}, A^{\frac{1}{4}}, A^{\frac{m}{n}}$ , designantes nimirùm radices per denominatores expositas, potestatum per numeratores,  $\sqrt[3]{A^2}, \sqrt[4]{A^3}, \sqrt[n]{A^2}, \sqrt[n]{A^m}$ . Indices verò *negativi*,  $A^{-2}, A^{-3}, A^{-m}, A^{-\frac{1}{2}}, A^{-\frac{1}{3}}, A^{-\frac{m}{n}}$ , indicant *reciprocis* affirmativorum,  $\frac{1}{A^2}, \frac{1}{A^3}, \frac{1}{A^m}, \frac{1}{A^{\frac{1}{2}}}, \frac{1}{A^{\frac{1}{3}}}, \frac{1}{A^{\frac{m}{n}}}$ .

\* Atque hoc pacto, *fractiones tolli*, et *æquationes concinnari* possunt, transponendo quantitates indicibus negativis insignitas, à numeratore in denominatorem; aut vice versâ.

$$\begin{aligned} \text{Sic } \frac{A^2}{A^3} &= \frac{1}{A^1} = A^{-1}; \text{ et } \frac{A^m}{A^n} = \frac{1}{A^{n-m}} = A^{m-n}; \text{ et, } A^{\frac{1}{2}-3} = \frac{1}{A^{3-\frac{1}{2}}} \\ &= \frac{1}{A^{2+\frac{1}{2}}}; \text{ et, } A^{\frac{m}{n}-3} = \frac{1}{A^{3-\frac{m}{n}}}, \text{ et, sic, } \frac{naA^{n-1}}{A^n} \times \frac{1}{A^n} = \frac{na}{A} \times \frac{1}{A^n} = \\ &= \frac{na}{A^{n+1}} = naA^{-n-1}. \end{aligned}$$

---

*De Methodo Fluxionum Directâ.*

---

83. Continentur canones, seu methodi hujusce regulæ, in theoremate quodam generalissimo, omnes casus comprehendente :

LEMMA II.

“Momentum genita ( $A^m B^n$ ) æquatur momentis (i. e. summa momentorum, scilicet ( $a + b$ ) laterum singulorum generantium ( $A, B$ ) in eorundem laterum indices dignitatum ( $m, n$ ) et co-efficientia ( $A^{m-1} B^n, B^{n-1} A^m$ ), continuè ductis.” Seu fluxio  $A^m B^n = maA^{m-1} B^n + nbB^{n-1} A^m$ .

N. B. Phraſi.

N. B. Phraſi Newtoniana, "*Lateris cujuſque generantis co-efficiens, eſt quantitas quæ oritur, applicando [totam quantitatem] genitam ad hoc latus.*" Sic lateris A

co-efficiens eſt  $\frac{A^m B^n}{A} = A^{m-1} B^n$ ; et lateris B, eſt  $\frac{A^m B^n}{B} = B^{n-1} A^m$ .

84. Auſpicatur *Newtonus*, à caſu ſimpliciſſimo.

*Caſ. 1. Fluxio reſt anguli geniti (AB) æquatur fluxionibus laterum generantium (a et b) in ipſa latera (B et A) continuè duëtis; ſeu fluxio AB = aB + bA.*

Reſt anguli cujuſvis perpetuò fluentis, ſint latera, vel æquabilitèr vel pari inæquabilitate creſcentia, per datam quandam temporis particulam, in medio ſtatu mutationis, A et B. Sumantur horum ſemi-momenta antecedentia, pro decrementis,  $-\frac{1}{2}a$  et  $-\frac{1}{2}b$ ; conſequentia autèm, pro incrementis,  $+\frac{1}{2}a$  et  $+\frac{1}{2}b$ . Laterum igitur variabilium prodibunt valores ſucceſſivi, eorùmque differentiarum correfpondentes à mediis :

Val. A.	Diff.	Val. B.	Diff.
$A - \frac{1}{2}a$	$\left. \begin{array}{l} - \frac{1}{2}a \\ + \frac{1}{2}a \end{array} \right\}$	$B - \frac{1}{2}b$	$\left. \begin{array}{l} - \frac{1}{2}b \\ + \frac{1}{2}b \end{array} \right\}$
A		et B	
$A + \frac{1}{2}a$	$\left\{ \begin{array}{l} + \frac{1}{2}a \\ + a \end{array} \right.$	$B + \frac{1}{2}b$	$\left\{ \begin{array}{l} + \frac{1}{2}b \\ + b \end{array} \right.$

Horum valorum primi erunt minimi, et poſtremi, maximi; ſed fluxiones laterum ſunt eorum incrementis totis ſimultaneis, a et b, proportionales reſpectivè; et proinde jure exponentur per ſummas differentiarum, a + b.

Reſt anguli quoque variabilis, prodibunt valores ſucceſſivi, eorùmque differentiarum, à medio valore, AB :

Val.	Diff.
$(A - \frac{1}{2}a) \times (B - \frac{1}{2}b) = AB - \frac{1}{2}aB - \frac{1}{2}bA + \frac{1}{4}ab$	$\left. \begin{array}{l} - \frac{1}{2}aB \\ - \frac{1}{2}bA \\ + \frac{1}{4}ab \end{array} \right\}$
$A \times B = AB$	
$(A + \frac{1}{2}a) \times (B + \frac{1}{2}b) = AB + \frac{1}{2}aB + \frac{1}{2}bA + \frac{1}{4}ab$	$\left\{ \begin{array}{l} + \frac{1}{2}aB \\ + \frac{1}{2}bA \\ + \frac{1}{4}ab \end{array} \right.$

(g) "*Quantitates differentiarum ſuis proportionales ſunt continuè proportionales.*" Et converſim quantitatibus continuè proportionalium erunt differentiarum ipſis quantitatibus proportionales.

1. Sit A ad A — B ut B ad B — C, et C ad C — D, &c. Et convertendo fiet A ad B ut B ad C, et C ad D.

2. Sit A ad B ut B ad C, &c. Et iterùm fiet A ad A — B ut B ad B — C.

Vide *Maclaurin's Fluxions*, § 159—260, ubi prolixè demonſtratur et Theoriæ Fluxionum Logarithmarum applicatur.

Et horum valorum quoque, erit primus minimus, et postremus, maximus. Sed fluxio rectanguli incrementis laterum *totis*  $a$  et  $b$  geniti, erit incremento toti proportionalis; et proindè jure exponetur per summam differentiarum,  $aB + bA$ .

Si negas, fingatur fluxionem veram esse vel majorem vel minorem, quantitate quâvis assignabili  $D$ , seu,  $aB + bA \pm D$ . Quod si major foret, emergere *possit* dimidium novæ fluxionis,  $\frac{aB + bA + D}{2}$  majus maximâ, (per constructionem) differentiarum,  $\frac{1}{2}aB + \frac{1}{2}bA + \frac{1}{2}ab$ ; et proindè non ritè exprimeret augmentum rectanguli post medium statum  $AB$ : sin minor, emergere *possit* dimidium novæ fluxionis  $\frac{aB + bA - D}{2}$ , minus minimâ differentiarum,  $\frac{1}{2}aB + \frac{1}{2}bA - \frac{1}{2}ab$ ; et proindè non ritè exprimeret augmentum rectanguli ante medium statum  $AB$ . Q. E. D.

In numeris res patebit:

Sit  $A = 20$ , et  $a = 2$ ;  $B = 30$ , et  $b = 4$ ; erunt

	<i>Val.</i>	<i>Diff.</i>
$(A - \frac{1}{2}a) \times (B - \frac{1}{2}b) = 19 \times 28 = 532$	532	} 68
$A \times B = 20 \times 30 = 600$	600	
$(A + \frac{1}{2}a) \times (B + \frac{1}{2}b) = 21 \times 32 = 672$	672	} 72
	140.	

Sed  $aB + bA = 60 + 80 = (140 =) 68 + 72$ .

85. Demonstrationem totam brevissimè expedit *Newtonus*:

"Rectangulum quodvis *motu perpetuo* auctum  $AB$ , ubi de lateribus  $A$  et  $B$  deerant momentorum dimidia  $\frac{1}{2}a$  et  $\frac{1}{2}b$ , fuit  $A - \frac{1}{2}a$  in  $B - \frac{1}{2}b$ , seu  $AB - \frac{1}{2}aB - \frac{1}{2}bA + \frac{1}{2}ab$ ; et quàm primum latera  $A$  et  $B$  alteris momentorum dimidiis aucta sunt, evadit  $A + \frac{1}{2}a$  in  $B + \frac{1}{2}b$ , seu  $AB + \frac{1}{2}aB + \frac{1}{2}bA + \frac{1}{2}ab$ . De hoc rectangulo subducatur rectangulum prius, et manebit *excessus*  $aB + bA$ . — Igitur laterum incrementis *totis*  $a$  et  $b$ , generatur rectanguli incrementum  $aB + bA$ ." Q. E. D.

In hac demonstratione, *Newtonus*, neglecto medio valore rectanguli fluentis, nempe  $AB$ , simul ac semel, subducit minimum valorem de maximo; et inde, *excessus* designabit totum rectanguli augmentum *totis* momentis  $a$  et  $b$  generatum, (sive summam differentiarum minimi valoris à medio, et medii à maximo); sed *argumentum ad absurdum* omittit, quasi ex suis principiis in *Lemmate primo* satis manifestum. Vid. § 16. Not. (c).

86. Demonstrationis *Newtonianæ* vim atque subtilitatem minimè capiens "*Analysta*" (*Berkeley*), validitatem ejus imperitè improbavit. Nec satis perspexerunt vindices, *Colson* et *Maclaurin*: *Colson* enim *argumentum ad absurdum*, propositioni plenè, perfectè et rigidè demonstrandæ necessarium, omisit; *Maclaurin* verò vicissim, priorem demonstrationis partem, à *Colson* benè explicatam, paritèr

PARS SECUNDA.

paritèr omisit; huic parti posteriori tantùm immorans, prolixius et obscurius, in demonstratione parallelâ fluxionis *quadrati*; unde, ordine inventoris lucido in pejus mutato, fluxionem *rectanguli* deducit; *non bene reliâ* interpretis *par-mulâ*: sicut in *Parte Primâ* monuimus, § 16.

87. Analytæ recentiores quoque, *Euler*, (§ 72.) &c. solidam et rigidam demon-strandi viam *Newtonianam* deferentes, rem paulò alitèr instituunt, ex *metbodo infinitesimalium*.

Laterum generantium sint postremi valores,  $x + \dot{x}$  et  $y + \dot{y}$ ; emerget postremus quoque valor rectanguli simultanei, his in se ductis,  $xy + \dot{x}y + x\dot{y} + \dot{x}\dot{y}$ . De hoc valore subducatur primus,  $xy$ , et manebit *excessus*  $\dot{x}y + x\dot{y} + \dot{x}\dot{y}$ ; nempe incrementis  $\dot{x}$  et  $\dot{y}$  generatus; cæterùm terminus ultimus  $\dot{x}\dot{y}$ , utpotè *in-finitè parvus*, tutò *negligi* potest: et proindè incrementum ipsius rectanguli quàm proximè exponet  $\dot{x}y + x\dot{y}$ ; five substitutis, pro incrementis  $\dot{x}$  et  $\dot{y}$ , fluxi-onibus  $\dot{x}$  et  $\dot{y}$ , fluxionem rectanguli exponet  $\dot{x}y + x\dot{y}$ . Q. E. D.

Vide *Huston's Mathematical Dictionary*, voce *Fluxion*, p. 487; unde hanc demonstrationem *Newtonianæ* (ibidem malè omittæ) evidentiâ et elegantiâ longè cedentem, deprompsimus: Nam fluxionem rectanguli variabilis, quam in statu mutationis *primo*,  $xy$ , non nisi *quam proximè* exponit  $\dot{x}y + x\dot{y}$ ; in statu *medio*, seu *limite* in ipso,  $AB$ , longè accuratius exponit  $aB + bA$ , secundùm construc-tionem *Newtonianam* artificiosiore.

88. Atque ex hujus demonstrationis subtilissimæ genio seu indole, *metbodem limitum* indubitato respiciente, optimè forsàn explicare licet principium illud spinosissimum et vexatissimum, sed nobilissimum et generalissimum sanè, unde pendet omnis theoria *Newtoniana* virium centripetarum, *Princip. Lib. I. Prop. 1. Cor. 3. et 4.*

*Cor. 3.* “*Vi-res centripetæ in [mediis arcuum momentaneorum ABC et DEF] B et E, sunt ad invicem in ultimâ ratione diagonalium BV, EZ, [quæ convergunt ad centrum virium S] ubi arcus isti in infinitum diminuuntur.*”

Nam vires centripetæ, in his mediis locis B et E, utpote *acceleratrices*, propriè mensurantur per *velocitates* versùs commune centrum motûs cadendo acquisitas, æqualibus his temporibus quàm minimis; atque hæ iterùm *velocitates genitæ*, utpote temporum quam minimorum decursu, ferè æquabiles, ob hæc tempora, per hypothesin, æqualia, erunt ut *spatia*, impulsibus vis centripetæ in locis B et E interim generata versùs commune centrum motûs S; five *deflexiones* de extremis  $c$  et  $f$  tangentium per B et E ductarum; cæterùm hæ deflexiones ferè ( $b$ ) coincident cum *subtensis* angulorum contactûs  $cC$ ,  $fF$ , ubi arcus isti

( $b$ ) Vide *La Caille, Elémens d'Astronomie*, seu Versionem Anglicanam à *Robertson*, § 157, et fig. 33. ubi gradus hic demonstrationis præcipuus, à *Newtono* omissus, et à commentatoribus malè neglectus, optimè suppletur: ibi enim notantur *æ deflexiones veræ* versùs centrum per  $QR$ ,  $pF$ , quæ cum *subtensis* angulorum contactûs, radio vectori parallelis respectivè, ferè coincidunt.

ABC et DEF *in infinitum diminuuntur*; (nimirum recedendo utrinque ab extremis A et C, atque D et F, versus media B et E, respectivè); itémque hæ subtensæ  $cC$ ,  $fF$ ;—si resolvatur totus revolutionis motus per *semiarcs* BC et EF, (qui utique cum *chordis* suis et cum *tangentibus* suis Bc et Ef ultimò coincident, per Lem. 7.) binos in motus, unum, secundum directiones tangentium, et alterum, secundum directiones radiorum vectorum BS, et ES,—erunt parallelæ et æquales *diagonalibus* BV et EZ, quæ convergunt ad centrum virium et chordas AC, DF bisecant: ergò *vires*, &c. erunt *ipsis diagonalibus* proportionales. Q. E. D.

In hac demonstratione, (quam, brevissimè à *Newtono* absolutam, fusiùs explicuimus,) quis non videt quod “*ubi arcs isti in infinitum diminuuntur*,” nimirum recedendo utrinque, &c. *semiarcs* priores AB, DE antè media puncta B et E, *decrementis*  $-\frac{1}{2}a$ ,  $-\frac{1}{2}b$ ; et *semiarcs* posteriores BC, EF, *incrementis*  $+\frac{1}{2}a$ ,  $+\frac{1}{2}b$ , respondent respectivè?

89. Cor. 4. “*Vires illæ centripetæ*, &c. sunt quoque proportionales *sagittis* illis quæ chordas bisecant arcuum quorumvis, *æqualibus* temporibus quam minimis descriptorum, et convergunt ad centrum virium.”

Nam hæ sagittæ sunt *semiffes diagonalium* prædictarum, seu  $\frac{1}{2}BV$ , et  $\frac{1}{2}EZ$ ; et proinde pro ipsis diagonalibus, (*veris* utique virium exponentibus,) compendii gratiâ, calculo cautè instituto, et servatâ ubique *semiffium proportionem*, per totum computum, tutò substitui possunt. Alièr enim suboriri possunt errores in calculo minimè contemnendi. Vide *Maclaurin's Fluxions*, § 440; *Simson's Fluxions*, Vol. I. p. 237; *La Lande, Astronomie*, § 3392; et *Milner, Philosoph. Transf.* anno 1779, Part II. p. 521.—Vide plura, § 103, et antea § 62 et 63.

90. Quò magis eluceant evidentia, certitudo et ubertas *primi bujus casûs*, quem totius methodi generalis fundamentalem constituit *Newtonus*, placet insuper ex considerationibus *Geometricis*, abstractiùs et subtiliùs hætenùs tradita, illustrare.

1. Lateribus generantibus, A et B, *uniformitèr* crescentibus, sive in eadem, sive in datâ quâdam ratione ad se invicem; erit *diagonalis* rectanguli duplici motu geniti *recta linea*. Et *complementa* parallelogrammorum circâ diagonalem ritè exponent fluxiones laterum respectivè; adeoque horum aggregatum fluxionem ipsius rectanguli geniti. Sed in hoc casu simplicissimo, erunt ipsa complementa æqualia, per *Prop. 43. Lib. I. Elem.*; sive  $aB = bA$ , adeoque areæ rectanguli fluxio  $= 2aB$  vel  $2aA$ . Et si latera sint æqualia, erit fluxio *quadrati*  $= 2aA$ .

2. Lateribus *differtitèr* crescentibus, seu in diversâ ab invicem ratione; ex. gr. si momentum *a* sit constans, at momentum *b* variabile, erit *diagonalis* rectanguli geniti *curva linea*; quæ erit *convexa* à parte baseos seu abscissæ motu constanti descriptæ, si *b* crescat; *concava* autem, si decrescat. In utroque casu, complementa illa quæ fluxiones laterum exponunt, erunt inæqualia.

Hinc forsàn *Sectiones Conicae*, nomina sua propria acceperunt: *Hyperbola*, quasi motu ordinatæ ὑπερβαλλοντι, “*redundante*,” genita; *Ellipsis*, quasi motu ἁλλειποντι, “*deficiente*,” et *Parabola*, παραβαλλοντι, seu motum ad *constantem* seu æquabilem *accedens*, genita. Arque his definitionibus nominum affectiones singularum sectionum probè respondent.

3. Crescente uno latere et decrescente altero, sive *constantè*, sive *diversimodè*, ob momentum posterioris jam negativum, — *b*, rectanguli fluxio fiet residua,  $aB - bA$ .

*Casu hoc primo*, omnium fundamentali, jam rigidè demonstrato ex principiis purè *Algebraicis*, omni *motûs formalis* seclusâ consideratione; et fusiùs illustrato ex *Mechanicâ Rationali* atque *Geometriâ*, secundùm mentem ipsius inventoris; reliquos casus brevius expedire fas erit; quibusdam aliundè intertextis.

91. *Cas. 1. Cor.*—Hinc fluxio fractionis  $\frac{A}{B}$  fiet  $\frac{aB - bA}{B^2}$ . Ponatur  $\frac{A}{B} =$

*Q*; eritque  $A = BQ$ . Adeoque per *Cas. 1.*  $a = qB + bQ$ ; sive  $q = \frac{a}{B} -$

$$\frac{bQ}{B} = \frac{a}{B} - \frac{b}{B} \times Q = \frac{a}{B} - \frac{b}{B} \times \frac{A}{B} = \frac{a}{B} - \frac{bA}{B^2} = \frac{aB}{B^2} - \frac{bA}{B^2} = \frac{aB - bA}{B^2} \quad Q. E. D.$$

92. *Fluxio contenti sub lateribus quocunque*, *A*, *B*, *C*, &c. æquatur summæ ex fluxionibus singulorum in reliqua latera sigillatim continuè ductis. Sic fluxio *ABC*, &c. =  $aBC$ , &c. +  $bAC$ , &c. +  $cAB$ , &c.

Ponatur  $AB = G$ . Et per *Cas. 1.* erit fluxio *ABC*, seu  $GC = gC + cG = (aB + bA) \times C + c \times AB = aBC + bAC + cAB$ . Et par est ratio contenti sub lateribus quocunque.

93. *Cas. 3. Fluxio dignitatis cujuscvis affirmativæ* ( $A^m$ ) æquatur *indici illius dignitatis* (*m*), *fluxioni lateris* (*a*), ejûsque *co-efficienti* ( $A^{m-1}$ ), in se continuè ductis. Seu, fluxio  $A^m = maA^{m-1}$ .

Fluxio quadrati  $A^2$ , seu  $A \times A$ , erit  $aA + aA = 2aA$ , per *Cas. 1.* Fluxio itèm cubi  $A^3$ , seu  $A \times A \times A$ , erit quoque  $aA^2 + aA^2 + aA^2 = 3aA^2$ , per *Cas. 2.*

Et, eodem argumento, fluxio  $A^m = maA^{m-1}$ . Q. E. D.

*Cor.* Hinc fluxio  $\frac{A^m}{m}$  erit  $aA^{m-1}$ .

G

*Scholium.*

*Scholium.* Proprietate curvarum elegantissimâ, si area quævis curvilinea super basi (AP) designetur per  $A^m$ , quolibet in statu mutationis; semper exponetur ordinata (PM) per  $maA^{m-1}$ . Vide *Maclaurin's Fluxions*, § 936, fig. 352.

94. *Cas. 4.* Fluxio dignitatis cujuscvis negativæ ( $A^{-m}$ ) æquatur indici, in lateris fluxionem ducta ( $-ma$ ), et per indicem genita unitate auctum divisa ( $m+1$ ). Seu fluxio  $A^{-m} = \frac{-ma}{A^{m+1}}$ .

Quantitatis constantis  $A \times \frac{1}{A} = 1$ , erit fluxio nihil, per Ax. 1. Fiat  $\frac{1}{A} = B$ ; eritque fluxio  $AB = aB + bA = 0$ . Adeoque  $b$ , seu fluxio  $\frac{1}{A}$  vel  $A^{-1}$ )  $= \frac{-aB}{A} = \frac{-a}{A} \times \frac{1}{A} = \frac{-a}{A^2}$ . Et generalitèr, quantitatis constantis  $A^m \times \frac{1}{A^m} = 1$ , fluxio erit nihil. Fiat  $\frac{1}{A^m} = B$ , eritque fluxio  $A^m \times B = bA^m + maBA^{m-1} = 0$ . Adeoque  $b$ , (seu fluxio  $\frac{1}{A^m}$  vel  $A^{-m}$ )  $= \frac{-maBA^{m-1}}{A^m} = \frac{-maB}{A^1} = \frac{-ma}{A^1} \times \frac{1}{A^m} = \frac{-ma}{A^{m+1}}$ . Q. E. D.

95. *Cas. 5.* Fluxio cujuscunque dimensionis fracta affirmativa ( $A^{\frac{m}{n}}$  æquatur indici illius dimensionis ( $\frac{m}{n}$ ), lateris fluxioni ( $a$ ), ejusque co-efficienti ( $A^{\frac{m}{n}-1}$ ), in se continuè ductis. Seu fluxio  $A^{\frac{m}{n}} = \frac{m}{n} a A^{\frac{m}{n}-1}$ .

Quantitatis  $A^{\frac{1}{2}} \times A^{\frac{1}{2}} = A$  fluxio erit  $a$ . Fiat  $A^{\frac{1}{2}} = B$ ; adeoque fluxio  $B^2$  (seu  $A^{\frac{1}{2}} \times A^{\frac{1}{2}}$ ) erit  $2bB = a$ ; et proinde  $b$  (seu fluxio  $A^{\frac{1}{2}}$ )  $= \frac{a}{2B} = \frac{a}{2A^{\frac{1}{2}}}$ . Et generalitèr: fiat  $A^{\frac{m}{n}} = B$ ; eritque  $A^m = B^n$ ; et proinde harum fluxiones erunt inter se æquales, nempe  $maA^{m-1} = nbB^{n-1}$ ; et dividendo

videndo utrinque per  $A^m = B^n$ , erit  $maA^{m-1} = nbB^{n-1}$ ; idcirco erit  $b$  (feu

$$\text{fluxio } B, \text{ five } A^{\frac{m}{n}}) = \frac{maA^{m-1}}{aB^{n-1}} = \frac{maA^{m-1}}{a \times A^{-\frac{m}{n}}} = \frac{maA^{\frac{m}{n}}}{a}. \quad Q. E. D.$$

96. N. B. Pro co-efficientis indice,  $\frac{m}{n} - 1$ , usurpat *Newtonus* indicem æquipollentem  $\frac{m-n}{n}$  ( $= \frac{m}{n} - \frac{n}{n}$ )  $= \frac{m}{n} - 1$ , in demonstratione hujus

casûs; unde prodit fluxio  $A^{\frac{m}{n}} = \frac{m}{n} aA^{\frac{m-n}{n}}$ . Eâdem nimirum notatione

indicum hâc occasione usus, ac compluribus ante annis, nempe anno 1676, ubi primò præclarum suum *Theorema Binomium* in lucem protulit. Vid. *ANALYS. ÆQUAT.* § 57. Cæterum hoc non levem suppeditat conjecturam, Methodum Fluxionum, vel illo tempore, Newtono perspicuè innotuisse; ut posthâc plenius et irrefragabiliùs evincetur ex insigni analogiâ inter terminos successivos seriei binomiæ, atque fluxiones superiorum ordinum, intercedente; talem enim analogiam inter utramque methodum, utriusque inventorem effugisse, suspicari non fas est.

97. *Cas. 6. Fluxio genitæ cujuscunque ex duobus pluribûsve factoribus, æquatur summæ ex fluxionibus uniuscujusque factoris in reliquam factorem vel reliquos factores, continuè inter se ductis.* Sic fluxio  $A^m B^n = maB^n A^{m-1} + nbA^m B^{n-1}$ .

Ex præcedentibus constat; nempe, *Cas. 1* et 3. Et par est ratio contenti sub pluribus factoribus; nam, per *Cas. 2*, erit fluxio  $A^m B^n C^r = maB^n C^r A^{m-1} + nbA^m C^r B^{n-1} + rcA^m B^n C^{r-1}$ .

Idem quoque obtinebit per *Cas. 5*, ubi indices factorum sunt *fraeti*,  $\frac{m}{n}$ ,  $\frac{r}{s}$ , &c.  $A^{\frac{m}{n}} B^{\frac{r}{s}}$ ; cujus fluxio evadet  $\frac{m}{n} a B^{\frac{r}{s}} A^{\frac{m}{n}-1} + \&c.$

Et hoc est *Theorema Fluxionale* nobilissimum et generalissimum, uno intuitu omnes casus comprehendens, ipsi *Theoremati Binomio*, elegantia, concinnitate et dignitatis præstantia vix, et ne vix quidem, cedens.

98. Conclusiones præcedentes nullo negotio ad notationem posteriorem accommodare licet.

Fluxio *rectanguli*  $xy = \dot{x}y + x\dot{y}$ .

Fluxio *contenti*  $xyz = \dot{x}yz + x\dot{y}z + xy\dot{z}$ .

Fluxio *quoti*  $\frac{x}{y} = \frac{\dot{x}y - x\dot{y}}{y^2}$

Fluxio *quadrati*  $x^2 = 2x\dot{x}$ .

Fluxio *dignitatis*  $x^m = m\dot{x}x^{m-1}$ .

Fluxio *dimensionis*  $x^{\frac{m}{n}} = \frac{m}{n}\dot{x}x^{\frac{m}{n}-1}$

Fluxio *genitæ*  $x^m y^n = m\dot{x}x^{m-1}y^n + n\dot{y}y^{n-1}x^m$ , vel,  
 $= (m\dot{x}y + n\dot{y}x) x^{m-1}y^{n-1}$ , vel,  
 $= (\frac{m\dot{x}}{x} + \frac{n\dot{y}}{y}) x^m y^n$ .

—Itémque,  $x^m y^n z^r = m\dot{x}x^{m-1}y^n z^r + n\dot{y}y^{n-1}x^m z^r + r\dot{z}z^{r-1}x^m y^n$ ,  
 vel,  $= (m\dot{x}yz + n\dot{y}xz + r\dot{z}xy) x^{m-1}y^{n-1}z^{r-1}$ ,  
 vel,  $= (\frac{m\dot{x}}{x} + \frac{n\dot{y}}{y} + \frac{r\dot{z}}{z}) x^m y^n z^r$ .

99. Corollaria quædam *Newtoniana*, à *Maclaurin* omiffa, hîc adjungere libet, ex præcedente theoriâ resultantia, eandemque optimè illustrantia, et in *Logarithmotechniâ* valdè utilia.

*Corol. 1. Hinc, in continuè proportionalibus, si terminus unus datur, fluxiones terminorum reliquorum, erunt ut iidem termini multiplicati per numerum intervallorum inter ipsos et terminum datum.*

Sunto A, B, C, D, E, F, continuè proportionales, et si *detur* terminus intermedius C, (cujus idcirco fluxio erit *nihil*;) exquirantur tùm valores reliquorum, ex notis proportionalium proprietatibus, tùm horum fluxiones, ex præcedenti theoriâ, itémque fluxionum rationes:

Proport.	Valor.	Flux.	1 Rat.	2 Rat.
A five	$\frac{C^2}{D^2}$	$C^2 \times \frac{-2\dot{d}}{D^2}$	$-\frac{2C^2}{D^2}$	$-2A$
B	$\frac{C^2}{D}$	$C^2 \times \frac{-\dot{d}}{D^2}$	$-\frac{C^2}{D}$	$-1B$
C	1	0	0	0
D	D	$\dot{d}$	$+D$	$+1D$
E	$\frac{D^2}{C}$	$\frac{2\dot{d}D}{C}$	$+\frac{2D^2}{C}$	$+2E$
F	$\frac{D^3}{C^2}$	$\frac{3\dot{d}D^2}{C^2}$	$+\frac{3D^3}{C^2}$	$+3F$

In hâc tabulâ, ex serie fluxionum elicitur prima series rationum  $-\frac{2C^2}{D^2}$ ,  
 $-\frac{C^2}{D}$ , &c.; multiplicando nimirum singulas fluxiones correspondentes, per  
 communem quantitatem  $\frac{D}{d}$ ; secunda series aptem, ex primâ, restituendo pro  
 valoribus suis, proportionales ipsos,  $-\frac{2C^2}{D^2} = -2A$ , &c. Q. E. D.

100. Corol. 2. *Et si in quatuor proportionalibus duæ mediæ dentur; fluxiones  
 extremarum erunt ut eadem extrema.*

Nam, ob datum idcirco rectangulum sub extremis AD (utpote æquale BC),  
 erit fluxio ejus  $aD + dA = 0$ ; idèoque,  $aD = -dA$ ; et proinde,  
 $a : -d :: A : D$ . Q. E. D.

*Idem intelligendum est de lateribus rectanguli cujuscunque dati.* Pari enim ratione,  
 erit  $b : -C :: B : C$ . Cæterum in hujusmodi casibus, ob fluxiones negativas.  
 $-c$ ,  $-d$ , diversimodè variantur latera generantia, uno crescente, altero de-  
 crescente.

101. Corol. 3. *Et si summa vel differentia duorum quadratorum detur, fluxiones  
 laterum erunt reciprocè ut latera.*

Sint enim quadrata  $A^2 \pm B^2 = 1$ , seu cuivis quantitati datæ; erit fluxio  
 $2aA \pm 2bB = 0$ . Adeoque,  $2aA = \mp 2bB$ ; et proinde,  $a : \mp b :: B : A$ .  
 Q. E. D.

---

### De Fluxionibus Superiorum Ordinum.

---

102. Si quantitates fluentes ratione constanti, æquabili seu datâ, simul au-  
 gentur vel minuuntur, fluxiones primas tantum, seu *primi ordinis*, fortientur.  
 Quod si harum fluxiones sint quoque variables, suas iterum fluxiones fortientur,  
*secundas* nempe, seu *secundi ordinis*; atque hæ iterum suas fortientur fluxiones  
 seu *tercias*; atque ita deinceps, donec ultimò perveniatur ad quantitates con-  
 stantèr seu æquabiliter fluentes.

103. Sic in theoriâ *virium centripetarum*, binis viribus conjunctis urgentibus,  
 revolvuntur corpora in orbibus, seu trajectoriis quibuscunque, circa commune  
 centrum virium: nempe, *vi projectili*, quæ constantèr et æquabiliter agit, se-  
 cundum directiones tangentium singulis in orbitæ locis; et *vi centripetâ*, perpetuo  
 motu *variabili*, corpora de tangentibus versùs centrum deflectente; cum actio  
 vis

vis projectilis igitur est *constans per se* (nisi quatenus per alteram vim *obliquè* agentem, augetur vel minuitur), *primas* tantum pariet fluxiones; quarum exponentes erunt *spatia* perbrevia æqualibus temporibus quàm minimis percurfa, seu *arcus* momentanei cum *tangentibus* suis ferè coincidentes. At *vis centripetæ*, cum accedendo versùs centrum, fortius, recedendo à centro, languidiùs operatur, actio erit variabilis, ejusque exponentes in locis correspondentibus, non erunt *ipsa spatia, momentanea* cadendo versùs centrum percurfa, si sisteretur vis projectilis (cum ipsæ deflexiones erunt variabiles, pro diversis à centro distantis), sed *horum dupla*, seu spatia quæ velocitatibus *ultimis* cadendo acquisitis describerentur (si exindè constantèr velocitates forent uniformes), per eadem tempora quam minima. *Vis centripeta*, igitur, *fluxiones suas secundas* fortietur; quarum exponentes sunt *diagonales illæ*, suprà memoratæ, quæ ad centrum commune virium convergunt: hæ enim sunt *duplæ sagittarum* illarum, quas corpora his momenti liberè cadendo, *actu* describerent. In *circulis* autem hæ sagittæ sunt ipsi *sinus versi*.—Atque hæ observationes, theoriæ illæ difficillimæ ac subtilissimæ virium *projectilium* et *centripetarum*, cui innititur omnis ASTRONOMIA NEWTONIANA, explicandæ et illustrandæ, haud leve adjumentum forsàn tyronibus suppeditabunt.

104. Fluxiones superiorum ordinum iisdem legibus inveniendæ sunt ac ipsæ

*fluxiones primæ*. Sic generalitèr: genitæ cujuscunque  $A^{\frac{m}{n}}$  erit

$$\text{Fluxio prima, per Caf. 5,} \quad - \quad - \quad - \quad - \quad \frac{m}{n} a A^{\frac{m}{n}-1};$$

$$\text{Secunda,} \quad - \quad \left(\frac{m}{n} - 1\right) \times (a) \times \left(\frac{m}{n} a A^{\frac{m}{n}-2}\right) = \frac{m}{n} \cdot \frac{m}{n} - 1 a^2 A^{\frac{m}{n}-2};$$

$$\text{Tertia,} \quad - \quad \left(\frac{m}{n} - 2\right) \times (a) \times \left(\frac{m}{n} \cdot \frac{m}{n} - 1 a^2 A^{\frac{m}{n}-3}\right) = \frac{m}{n} \cdot \frac{m}{n} - 1 \cdot \frac{m}{n} - 2 a^3 A^{\frac{m}{n}-3}.$$

Et sic deinceps, eadem servatâ lege derivationis. Ut, si cubi  $A^3$  quærantur fluxiones: designante  $\frac{m}{n}$ , 3; erit *fluxio prima*, - -  $3aA^2$ ;

$$\text{secunda,} \quad - \quad 6a^2A;$$

$$\text{tertia,} \quad - \quad 6a^3.$$

Fluxio autem *quarta* erit *nihil*; jam evanescente factore  $A$ .

Hinc, si genitæ index sit numerus integer, series erit finita; sin fractus, indefinita.

105. Combinando autem terminos inter operandum inventos, brevius exponere licet seriem fluxionalem, ponendo nimirum,  $\frac{m}{n} = p$ ;  $\frac{m}{n} \cdot \frac{m}{n} - 1 =$

$q$ ;  $q \times \frac{m}{n} - 2 = r$ ; erit  $pa A^{\frac{m}{n} - 1}$ , fluxio prima,

$qa^2 A^{\frac{m}{n} - 2}$ , fluxio secunda,

$ra^3 A^{\frac{m}{n} - 3}$ , fluxio tertia,

$sa^4 A^{\frac{m}{n} - 4}$ , fluxio quarta.

Atque ulterius combinando, formam adhuc simplicioremm indicet series; ponendo  $pa = P$ ;  $\frac{m}{n} - 1 \times aP = Q$ ;  $\frac{m}{n} - 2 \times aQ = R$ .  $\frac{m}{n} - 3 \times aR = S$ , &c. erit jam series,

$PA^{\frac{m}{n} - 1} + QA^{\frac{m}{n} - 2} + RA^{\frac{m}{n} - 3} + SA^{\frac{m}{n} - 4} + \&c$ ; ipsa *seriei binomialis*, in simplicitate non inferior.

*De Theoremate Binomio.*

106. In *Appendice ad ANALYSIN ÆQUATIONUM*, p. 33, &c. dudum demonstratum est, "*ex principiis Algebrae propriis*," (ut ibi dictum,) ad mentem *Johannis Landen*, in tractatu suo *De Analyfi Residuâ*, theorema hoc longè celeberrimum, sub variis ejus formulis, § 57; (quales protulit *Newtonus*, in Epistolis cum *Leibnitz* communicandis, an. 1676,) atque sub formulâ usitatiorè, *Cor. 1.* qualem non semel adhibuit ipse *Newtonus*. Ex. gr. *Prop. 45. Lib. 1. Princip.*

ubi statuit *radius vectorem*.  $A^n = (T - X)^n = T^n - nXT^{n-1} + \frac{n^2 - n}{2} X^2$

$T^{n-2}$ , &c. Atque iterum, in *Scholio, Prop. 93, ordinatam*  $(A + O)^{\frac{m}{n}} = A^{\frac{m}{n}}$

$+ \frac{m}{n} O A^{\frac{m}{n} - 1} + \frac{m(m-1)}{2nn} O^2 A^{\frac{m}{n} - 2}$ , &c. — Pleniorè et fusiorè explicationem

Nam tertius terminus est ad secundam fluxionem in ratione  $\frac{1}{2}$  ad 1, seu 1 ad 2.

Quartus terminus ad tertiam fluxionem in ratione  $\frac{1}{2} \times \frac{1}{3}$  ad 1, seu 1 ad  $2 \times 3 = 6$ .

Quintus terminus ad quartam fluxionem in ratione  $\frac{1}{2} \times \frac{1}{3} \times \frac{1}{4}$  ad 1, seu 1 ad  $2 \times 3 \times 4 = 24$ .

Et generalitèr, terminus quilibet  $m + 1$ , ad fluxionem ordinis  $m$  proximè inferioris, in ratione  $\frac{1}{2} \times \frac{1}{3} \times \frac{1}{4} \dots \frac{1}{m}$  ad 1, seu 1 ad  $2 \times 3 \times 4 \times 5 \&c \times m$ ; hoc est, in ratione datâ.

109. Et hinc facillimè quidèr, et optimè forsàn, ex theoriâ fluxionum *germanâ* derivatur constructio seriei ex resolutione theorematis binomii resultantis; nam quilibet seriei terminus  $m + 1$  invenietur dividendo fluxionem ordinis  $m$  per  $2 \times 3 \times 4 \dots m$ . Sic terminus seriei *sextus* est æqualis fluxioni *quinta*,

$14^5 A^{\frac{m}{5} - 5}$ , per  $24 \times 5$  divisâ. Et vicissim, ex serie binomiâ inveniri possunt fluxionum ordines.

110. Simplicitate atque facilitate longè præstat hæc demonstratio, ex fluxionum *serie* petita, *Landeniana* isti breviori, ex consideratione *primæ* fluxionis tantùm hautæ; ab eâ quam dudum exposuit *Maclaurin*, § 748, vix discre-

panti; quippe quæ primo *assumit*, quantitatem binomiam  $(1+x)^{\frac{m}{n}}$  designari posse per seriem indicibus integris, perpetuò crescentem,  $1 + ax + bx^2 + cx^3 + dx^4$ , &c.

Et harum quantitatum fluxionibus utrinque inventis, erit  $\frac{m}{n} \times (1+x)^{\frac{m}{n} - 1} \times x = ax + 2bx^2 + 3cx^3 + 4dx^4$ , &c. unde, dividendo omnes terminos

per  $x$ , emergit æquatio finalis  $\frac{m}{n} \times (1+x)^{\frac{m}{n} - 1} = a + 2bx + 3cx^2 + 4dx^3$ , &c.; eadem prorsùs ad quam tanto circuitu tandem pervenit methodus *Landeniana*; vide *Analyſin Æquationum*, p. 38. Cujus iterùm resolutio, calculo satis operoso, dabit valores singulorum co-efficientium,  $b, c, d$ , &c.

H

Hinc

Hinc manifestò liquet, *Analyfin Residuam* ipsam, cujus laudes tantopere prædicat *Landen*, vix discrepare in principiis suis, licet longè operosior ac tortuosior, à *Methodo Fluxionum*; ac proinde pro larvâ ejus jure censerî possit.

111. Ex dictis constat, *seriem binomiam*  $(A \pm c)^{\frac{m}{n}}$  citiùs convergere quam *series fluxionum genita*  $A^{\frac{m}{n}}$ ; ob decrementum terminorum prioris per denominatores successivos terminis posterioris subjiciendos,  $1 \times 2 = 2$ ;  $2 \times 3 = 6$ ;  $6 \times 4 = 24$ ; &c.

$$\text{Sic, } (A + a)^{\frac{m}{n}} = A^{\frac{m}{n}} + 3aA^{\frac{m}{n}-1} + 3a^2A^{\frac{m}{n}-2} + a^3.$$

$$\text{Fluxiones, } A^{\frac{m}{n}} = 3aA^{\frac{m}{n}-1} + 6a^2A^{\frac{m}{n}-2} + 6a^3.$$

*De Methodo Inversa Fluxionum.*

112. *Methodus Inversa*, seu *Calculus Integralis*, vicissim, ex fluxionibus datis invenire fluentes aggreditur. Estque "hoc molestissimum et omnium difficillimum problema," *Newtono* judice: nam hactenùs desideratur methodus generalis eruendi fluentes directè, seu immediatè ex fluxionibus; ad particulares casus tantùm restringitur investigatio, eodémque, maximâ ex parte, cursum relegendo methodi directæ.

Auspicari libet à casibus simplicioribus.

113. *Cas. 1. Fluxionum simplicium unius tantùm dimensionis fluentes substitutione solâ inveniuntur.*

Sic fluxionis  $a$ , fluens est  $A$ ; fluxionis  $\frac{m}{n} a$ ,  $\frac{m}{n} A$ ; vel fluxionis  $x$ , fluens  $x$ ;  $\frac{m}{n} x$ ,  $\frac{m}{n} x$ .

114. *Cas. 2. Fluxionum simplicium plurium dimensionum, fluentes resolutione regularum methodi directæ inveniuntur.*

Sic quoniam fluentis  $A^3$  fluxio fuit  $3aA^2$ ; dividendo priorem per posteriorem, prædit  $\frac{A}{3a}$ ; quæ utique, multiplicando datam fluxionem, dabit fluentem vicissim.

cissim. Itémque fluxionis  $3ax^4$ , multiplicando per  $\frac{x}{6x}$ , fluens erit  $\frac{3x^6}{6} = \frac{1}{2}x^6$ .

Et generalitèr, formulæ  $\frac{m}{n} aA^{\frac{m}{n}-1}$ , multiplicando per  $\frac{A}{\frac{m}{n}a}$ , eruetur fluens

quæsitæ  $A^{\frac{m}{n}}$ . Similitèr, formæ  $aA^{m-1}$  erit fluens  $\frac{A^m}{m}$ , ut ex casibus 3 et 5 methodi directæ constat.

115. Methodum directam excogitavit *Pacassi* inveniendi fluentes, instituendo analogiam: *Ex fluxione (x) datâ, eliciatur nova quædam fluens (y); eritque bujus fluxio (y) ad fluxionem datam (x) ut fluens elicitæ (y) ad fluentem quæsitam (x)*: et indè prodit  $x = \frac{xy}{y}$ .

Sit fluxio data  $3aA^2$ ; substituendo  $A$  pro  $a$ , emergit nova fluens  $3A^2$ ; inveniatur hujus fluxio,  $9aA^2$ ; undè prodibit  $\frac{3aA^2 \times 3A^2}{9aA^2} = A^2$ , fluens quæsitæ. Atque hæc regula, licet præcedente operosior, in *fluentium correctione* per methodum inverſam inventarum, ufui esse potest.

116. Fluxionis compositæ, unius tantùm dimensionis formulæ  $xy \pm xy$ , inveniatur fluens, substituendo fluentes pro fluxionibus, et dimidiando aggregatum; nam  $\frac{xy + xy}{2} = xy$ . Et paritèr, formulæ  $\frac{xy - xy}{2}$  fluens erit  $\frac{xy + xy}{2} = \frac{x}{y}$ .

117. Veruntamen sæpenumerò occurrunt quantitates fluxionales magis compositæ, quarum fluentes per regulas prædictas neutiquàm eruere licet. Decursu autem computorum fluxionalium, complures formulæ fluentiales, formulis fluxionalibus magis compositis respondentes, inventæ sunt ab analyſtis celeberrimis, inter operandum, et potissimùm, à *Newtono*, *Cosus*, *Euler*, *Clairaut*, *Walmſley*, *Landen*, *Simpson*, *Waring*, *De La Grange*, &c.; quarum præcipuæ ad calcem capitis de Fluxionibus Logarithmorum reperiuntur, § 132.

---

### De Correctione Fluentium.

---

118. Caterùm fluentes hoc pacto repertæ, sive per regulas præcedentes, sive per formulas, hæud rarò correctione quâdam ulteriore egent, quo ad

amiffim respondeant cafibus problematum fluxionalium particularibus inven-  
endis. Nam fluxionis  $\dot{x}$  fluens effe potest vel  $x$ , vel  $x \pm c$ , feu  $x$  constanti  
quâdam quantitate,  $c$ , aucta vel diminuta; adeò ut fluens jam inventa, conditio-  
nibus quibusdam, quæ problema aliquatenùs restringunt, poterit forsàn non  
accuratè respondere. Unde necesse erit ulteriùs fluentem veram eruere ex ipsius  
problematis conditionibus, relationem fluentium ad invicem in certo quodam  
temporis puncto, aut mutationis statu, definientis seu limitantis. Reducatur  
igitur generalis æquatio fluentialis ad istum statum particularem, substituendo  
pro fluentibus ipsis cognitos, quos sortiuntur, valores. Deinde subducatur æquatio  
resultans ex æquatione generali, et residua utrinque æquationem correctam  
fluentium ex regulis inventarum, elicient.

Ut, si æquatio fluxionalis sit  $\dot{z} = ax^4$ , æquatio fluentialis potest effe vel  
 $z = ax^4$ , vel  $z = ax^4 \pm c$ . Si simul evanescunt  $x$  et  $z$ , substituendo 0 pro  
 $x$  et  $z$ , fiet æquatio  $0 = 0 + c$ . Adeoque  $c = 0$ : quo in casu,  $ax^4$  veram  
fluentem exponet, evanescente  $c$ .

2. At, si, evanescente  $z$ , restat  $x = b$ , finitæ cuidam quantitati cognitæ; fiet  
æquatio fluentialis, in isto casu,  $0 = ab^4 + c$ : unde prodit  $c = -ab^4$ ; et  
substituto hoc valore, prodit  $z = ax^4 - ab^4$ .

3. Fiat jam  $z = d$ , isto in statu ubi  $x$  fit æqualis  $b$ ; et his valoribus substi-  
tutis, emerget æquatio fluentialis  $d = ab^4 + c$ ; adeoque erit  $c = d - ab^4$ ;  
et, substituto iterùm hoc valore pro  $c$ , prodit  $z = ax^4 - ab^4 + d$ , valor ni-  
mirùm correctus fluentis quæsitæ.

4. Idem quoque brevius expedire licet, simul et semel substituendo valores  
quosvis contemporaneos quantitatum  $x$  et  $z$ . Nam si ab æquatione fluentiali  
 $z = ax^4$ , subducatur novus valor  $d = ab^4$ , fiet residuum  $z - d = ax^4 - ab^4$ ;  
adeoque  $z = ax^4 - ab^4 + d$ , ut antea: aut igitur evanescuntibus  $b$  et  $d$ , aut  
æquatis  $+d$  et  $-ab^4$ , fiet ipsa fluens quæsitæ  $ax^4$ .

*De Fluxionibus Diversas Fluentes admittentibus.*

119. Nullâ re magis arguitur imperfectio *Methodi Inversa*, quam quòd eadem  
æquatio fluxionalis seu differentialis, aliquando duas solutiones, omninò ab  
invicem diversas, sortiatur; quod primò detexit *Clairaut*, *Mem. Acad.* 1734, et  
postea confirmarunt *Euler*, *D'Alembert*, *De La Place*, *De La Grange*, et *Le Gendre*.  
Vide M. R. Append. Vol. 28, p. 537.

Hujusmodi est æquatio differentialis  $x dy dx - dy^2 = y dx^2 - dy dx$ ,  
five, secundùm notationem fluxionalem,  $x \dot{y} - \dot{y}^2 = y \dot{x}^2 - \dot{y} \dot{x}$ . Huic  
enim

enim solvendæ æquæ respondent vel æquatio fluentialis  $4y = x^2 + 2x + 1$ ,  
vel  $2ax - 2x = -4y + 1 - a^2$ .

Similiter quoque æquationem differentialem  $ady^2 + xdy^2 - ydydx =$   
 $x dy dx - y dx^2$  æquæ solvent, vel  $\frac{dy}{y} = \sqrt{y} = \sqrt{4a}$ , vel  $b^2y - 2bx$   
 $+ 2by = -4a$ .

Supereft ut breviter proponere aggrediar applicationem Fluxionum ad *Logarithmotechniam*, planius ut spero, et plenius, quam hactenus; ob ingentem Logarithmorum utilitatem in Calculis Trigonometricis, &c. abbreviandis; idque libentius, quod inter celeberrimorum *Scriptorum Logarithmicorum* congesta opera locum habere permittatur hæc *Analysis Fluxionum*, mole quidem parva, sed quæ tamèn, pro rerum difficultate, subtilitate, varietate, et pondere, (quæ fortasse fufius explicari debuiffent,) quantumvis impar, tanto honore non prorsus indigna videatur.

### De Fluxionibus Logarithmorum.

120. *Logarithmi*, quasi *λογων αριθμοι*, "*Rationum numeri exponentes*" sunt numeri arithmetice proportionales, numeris geometricè proportionalibus respondentes, seu secundum definitionem vulgatam, "*Numerorum proportionalium comites æquidifferentes*:" ut in seriebus insequentibus Logarithmorum vulgarium:

Numeri	{	8c. $10^4$ , $10^3$ , $10^2$ , $10^1$ , $10^0$ , $10^{-1}$ , $10^{-2}$ , $10^{-3}$ , &c.
		vel 1000, 100, 10, 1, .1, .01, .001, &c.
Logarithmi	{	3, 2, 1, 0, -1, -2, -3.

De utilitate insigni Logarithmorum in omni genere Computorum Arithmeti-  
corum, Trigonometricorum, abbreviando operationes *Multiplicationis*, *Divi-  
sionis*, *Involutionis* et *Evolutionis*, hoc loco monuisse tantum sufficiat: adeat harum  
rerum studiosus librum antea memoratum, cui titulus *Scriptores Logarithmici*, à  
viro cl. *Maseres* congestum et editum.

121. In omni systemate Logarithmorum, statuitur logarithmus unitatis esse  
nihil, aut 0. In omni systemate igitur, *summa logarithmorum cujusvis numeri  
logistici, ejusque reciproci*, cum sint æquales et contrariis signis affecti, fiet 0, seu  
evanescet.

In Systemate Logistico vulgari, seu *Briggiano*, semper *unitas* pro logarithmo numeri 10; at in Systemate Hyperbolico, seu *Neperiano*, *unitas* prodit logarithmus numeri 2.7182818, &c.

122. In quovis autem systemate, numerus, qui crescit vel decrescit eadem ratione ac logarithmus ejus, fit quasi *modulus* istius systematis: eritque *modulus unius systematis ad modulum alterius, ut logarithmus dati numeri in uno ad logarithmum ejusdem numeri in altero.*

Sic in systemate vulgari, logarithmus numeri 10 est 1; at in hyperbolico, logarithmus 10 est 2.3025850, &c. In hyperbolico, item modulus est 1; undè prodit modulus systematis vulgaris  $= \frac{1.0000000}{2.3025850} = 0.4342944$ .

Eritque *ratio modularis*, in systemate hyperbolico 1 ad 1, sive ratio æqualitatis; at in vulgari, 0.4342944 ad 1, nempe ratio data.

123. *Fluxiones logarithmorum, fluxionibus ordinis secundi ascribendæ sunt; cum ipsi logarithmi fluxionibus primis respondent: ut ex definitionibus constat.*

Methodus hæc inveniendi propositionibus insequentibus fundatur.

124. *Prop. 1. Quantitatum logisticae fluxiones sunt ipsis quantitatibus proportionales.*

Nam quoniam quantitates ipsæ proportionē *geometricā* crescunt vel decrescunt, erunt differentiæ earum ipsis quantitatibus proportionales, per conversam *Lem. 1. Lib. II. PRINCIP.* Et proinde, fluxiones, quæ variantur ut hæ differentiæ, erunt quoque ipsis quantitatibus proportionales. Q. E. D.

125. *Prop. 2. Fluxio quantitatis logisticæ est ad fluxionem logarithmi ejus, ut ipsa quantitas ad modulum systematis logisticæ.*

Per propositionem præcedentem est  $n$ , fluxio quantitatis  $N$ , ad  $n$ , fluxionem quantitatis  $M$ , ut  $N$  ad  $M$ . Designet  $M$  *modulum*; et quoniam  $m$  in hoc casu est constans, substitui potest pro fluxione logarithmi  $N$  quoque, cum hujus logarithmus est in datā quādam ratione ad modulum. Erit igitur  $n$ , fluxio ipsius  $N$  ad  $l$ , fluxionem logarithmi ejus, ut  $N$  ad  $M$ . Q. E. D.

126. *Prop. 3. In quovis systemate logarithmorum, fluxio logarithmi cujusvis dati æquatur fluxioni ipsius quantitatis logisticæ, in modulum ductæ, et per ipsam quantitatem divisæ.*

Nam (per præced.) est  $n : l :: N : M$ ; et invertendo,  $l : n :: M : N$ , sive  $l = \frac{nM}{N}$ . Q. E. D.

127. *Prop.*

127. Prop. 4. In systemate hyperbolico, fluxio logarithmi cuiusvis dati aequatur fluxioni ipsius quantitatis logarithmica, per ipsam quantitatem divisa.

Nam in hoc systemate,  $M = 1$ , et proinde,  $l = \frac{x}{N}$ . Q. E. D.

Idem quoque geometricè illustrare licet ex naturâ arearum hyperbolæ rectangulæ, inter curvam, asymptotas et ordinatas interclusarum. Designantibus enim  $x$  asymptoti abscissam;  $y$ , ordinatam; et  $m$ , quadratum constans, contentum utique asymptotis et parallelis à vertice ductis, seu modulum; (per naturam hyperbolæ,) erit  $xy = m$ ; adeoque,  $y = \frac{m}{x}$ ; et multiplicando utrinque per  $\dot{x}$ , erit  $\dot{x}y = -\frac{\dot{x}m}{x^2}$ , sive ob  $m = 1$ ,  $= -\frac{\dot{x}}{x}$ ; sed  $\dot{x}y$  est fluxio logarithmi dati; (per naturam hyperbolæ et logarithmorum communem). Ergo, &c. Q. E. D.

Hinc manifestum est quod hyperbolæ rectangulæ cujus axis est asymptotos, est curva logarithmica, seu curva ad designandum logarithmos, et eos quasi ante oculos ponendum, accommodata: crescentibus enim abscissis in progressionem Arithmeticâ, decrescent ordinatæ in progressionem Geometricâ.

De Fluxionibus Quantitatum Exponentialium.

128. Quantitates exponentiales sunt aliarum quantitatum potestates quarum indices sunt variables; sicut vel  $e^x$ , vel  $y^x$ ; quantum prima est potestas quantitatis constantis  $e$  variabili indice  $x$  designata, altera verò est potestas quantitatis variabilis  $y$ , variabili indice  $x$  pariter designata.

Cas. 1. Fiat  $e^x = z$ . Erítque  $\log. z = \log. e, \times x$ ; adeoque per præced.  $\frac{\dot{z}}{z} = \log. e, \times \dot{x}$ ; et proinde,  $\dot{z} = \log. e \times \dot{x} z = \log. e \times \dot{x} e^x$ . Sive fluxio quantitatis exponentialis ( $e^x$ ) aequatur ipsi quantitati ( $e^x$ ), in indicis fluxionem ( $\dot{x}$ ), et lateris logarithmum ( $\log. e$ ) continuè ducta. Q. E. D.

Cas. 2. Fiat  $y^x = z$ . Erítque  $\log. z = \log. y \times x$ ; adeoque  $\frac{\dot{z}}{z} = \log. y \times \dot{x} = \frac{\dot{y}}{y} \times \dot{x}$ ; et proinde,  $\dot{z} = \frac{\dot{y}}{y} \times \dot{x} z = \frac{\dot{y}}{y} \times \dot{x} y^x = \dot{y} \times y^{x-1}$ . Sive fluxio quantitatis exponentialis variabilis ( $y^x$ ) aequatur fluxioni lateris ( $\dot{y}$ ) in fluxionem indicis ( $\dot{x}$ ) et co-efficienti ( $y^{x-1}$ ) continuè ducta. Q. E. D.

---

*De Logarithmis Imaginariis.*

---

129. Logarithmi quantitatum impossibilium, ut  $\sqrt{-a} = a\sqrt{-1}$ , appellantur *Imagarii*; quales sunt fluentes fluxionum quarundam impossibilium, sicut  $\frac{x}{x\sqrt{-1}}$ . Nam quoniam fluxionis  $\frac{x}{x}$  fluens est logarithmus *verus* quantitatis realis  $x$ ; pari ratione, erit fluxionis  $\frac{x}{x\sqrt{-1}}$  fluens, quoque logarithmus *imaginaris* quantitatis impossibilis  $x\sqrt{-1}$ .

Veruntamen ubi tales quantitates in problematum solutionibus occurrunt, facile transmutari possunt in *arcus circulares*, aut *sectores veros*, ex *hyperbolicis impossibilibus*. Vide MACLAURIN, *Of the Analogy betwixt Circular Arcs and Logarithms*; *Fluxions*, § 762:—PLAYFAIR, *On the Arithmetic of Impossible Quantities*; *Phil. Trans.* an. 1778, p. 318; or, *Analyt. Aequat.* § 223, et *Scriptores Logarithmicos*, tomum secundum, in paginis 381, 382, &c - - ad 585, ubi methodus quam invenit celeberrimus Leibnitzius anno 1676 pro extensione duarum regularum à Cardano olim traditarum de radicibus æquationum cubicarum formæ  $x^3 + qx = r$  in omnibus earum casibus, et formæ  $x^3 - qx = r$  in primo earum casu, seu cum  $\frac{rr}{4}$  est major  $\frac{q^3}{27}$ , ad secundum casum formæ secundæ, in quo  $\frac{rr}{4}$  est minor ipsâ  $\frac{q^3}{27}$  (qui casus *irreducibilis* à scriptoribus Algebrae appellatur,) fusè et accuratè explicatur.

130. Analogiam inter *Methodum Fluxionum* et *Logarithmorum*, ex recentioribus primus detexisse videtur sagacissimus Kepler; qui logarithmos ritè definivit "*mensuras rationum*," sive "*numeros ratiuncularum inter rationem numeri alicujus ad unitatem intercedentium*." Cæterum antiquis penitus latuisse hanc analogiam, haud faciliè persuadeat, vel ex solo opere celeberrimo Apollonii, *De Sectione Rationis*; quâcum ad amplissimâ quadrat hæc expositio *Kepleriana*; atque, non injuriâ, Apollonio forsân debuit editor ejus, sagacissimus Halley, methodum suam egrègiâ, sed paulò reconditiorem exquirendi et construendi logarithmos, sive "*numeros rationum exponentes*," (optimâ nominis definitione usus), per varias combinationes et *sectiones rationum*, series logisticas citissimè convergentes instituendo; qui omnium primus, ut fertur, *problema inversum* extudit: *dato logarithmo invenire numerum ejus logisticum*.

131. Mc-

131. Methodum *Halleianam*, celeberrimam at perdifficilem quidè, acutiùs exposuit *Jones*, in *Synopsi Palmariorum Mathematicos*; plenissimè autem et luculentissimè pervestigavit analysta ex peritissimis *Maseres*, in magno suo repositoryo *Scriptorum Logarithmicorum*, tomo primo in paginis 235, 236, &c - - - 383, et tomo secundo in paginis 76, 77, &c - - - 152.

132. Accedit ultimò TABULA præcipuarum FORMULARUM FLUXIONALIUM et FLUENTIALIUM hætenùs repertarum, ex Cl. *Hutton's Mathematical Dictionary* excerpta.

*De Formularum Applicatione.*

133. Methodus applicationis hujusmodi est.

*Conferatur fluxio proposita cum formulis; nempè, partes correspondentes cum correspondentibus fluxionis tabularis quâcum consentit; et hisce valoribus substitutis in formulam fluentis generalem, invenietur fluens quæsitâ.*

Ex. gr. 1. *Invenire fluentem fluxionis*  $3x^{\frac{5}{3}}$ . Consentit hæc cum *primâ* formulâ. Adeoque, propter  $n - 1 = \frac{5}{3}$ , erit  $n = \frac{5}{3} + 1 = \frac{8}{3}$ ; eritque  $\frac{1}{n} x^n = \frac{3}{8} x^{\frac{5}{3}}$ . Et proinde fluens quæsitâ, multiplicando per 3, co-efficientem fluxionis datæ, erit  $3 \times \frac{3}{8} x^{\frac{5}{3}} = \frac{9}{8} x^{\frac{5}{3}}$ .

2. *Invenire fluentem fluxionis*  $\frac{x^3}{1+x^3}$ . Consentit hæc cum *octavâ* formulâ.

Nam prodit  $\frac{x^{-1}x}{a+x^n} = \frac{x^3}{1+x^3}$ , itémque  $n = 3$ , et  $a = 1$ ; quibus substitutis in formulam fluentis generalem, prodit fluens quæsitâ  $\frac{1}{3} \log. \frac{1}{1+x^3}$ .

3. Invenire fluentem quantitatis  $5x^2\sqrt{c^3-x^3}$  seu  $5x^2(c^3-x^3)^{\frac{1}{2}}$ . Quadrat hæc cum formulâ secundâ. Erit igitur  $a = x^3$ ,  $m - 1 = \frac{1}{2}$ , seu  $m = \frac{3}{2}$ , et  $n = 3$ ; quibus substitutis, prodit fluens quæsitâ,  $5 \times \frac{1}{\frac{3}{2} \times 3} (c^3 - x^3)^{\frac{3}{2}}$   
 $= \frac{10}{9} (c^3 - x^3)^{\frac{3}{2}}$ .

134. Ubi quantitas fluxionalis proposita nullis ex his formulis finitis respondeat, inveniri potest ejus fluens quàm proximè, *resolvendo propositam in seriem infinitam; vel per divisionem, vel per theorema binomium; et inveniendo singulorum terminorum fluentes; quorum summa ad libitum continuatorum, dabit fluentem quæsitam, proximè aut quam proximè.*

4. Invenire fluentem  $\frac{1-x}{1+x-x^2}x$ . Dividendo numeratorem per denominatorem, prodit  $x - 2x^2 + 3x^3 - 5x^4 + 8x^5$ , &c. Et inventis singulorum fluentibus, prodit summa  $x - x^2 + x^3 - \frac{5}{3}x^4 + \frac{8}{5}x^5$ , &c. fluens quæsitâ.

De correctione fluentium per regulas aut per formulas inventarum, vide suprâ, § 118.

### DE ANALYSI ANTIQUA.

§ 135. ANALYSIN Antiquam, qualem exercebant clarissimi Geometræ veteres, *Euclides, Archimedes, Apollonius, &c.* jamdudum laudavimus; optimam fanè, judice in hisce versatissimo, *Halley, ANALYS. ÆQUAT. § 128.* Et quàm curiosâ felicitate eandem excoluit et auxit *Newtonus*, ex operibus ejus philosophicis abundè constat. Placet igitur, hoc tempore, ubi labefactantur PHILOSOPHIÆ NATURALIS vel ipsa PRINCIPIA MATHEMATICA, et juventuti nostræ horum studiosæ potiùs commendantur, (utpotè majoris evidentiae, et rigoris geometrici,) “*functiões quædam analyticae,*” “*fluxiones hypotheticae,*” è *Schoia Gallicâ* novatrice profluentes, eximiam illam *Præfationem Pappi Alexandrini*, ex Editione Halleianâ *Apollonii de Sectione Rationis*, hoc loco edere ab integro.

136. “*Locus de Resolutione* inscriptus, *Hermodore* fili, ut paucis dicam, propria quædam est materia in eorum usum designata qui, perceptis *communibus elementis*, in GEOMETRIA facultatem sibi desiderant *investigandi solutiones problematum*, et in hunc finem solummodò utilis. Traditur autem à tribus viris, *Euclide*, nempe, *Elementorum* scriptore, *Apollonio Pergæo*, et *Aristæo* seniore.

1. “*Procedit verò, per Methodum Resolutionis et Compositionis. Resolutio* (ἀναλυσις) *autem est methodus quæ à quæsito quasi jam concesso, per ea quæ deinde consequuntur ad conclusionem aliquam cujus ope compositio fit, (ἐπὶ τὴν ὁμολογούμενον ἐν συνθεσὶ) perducamur.* In resolutione enim quòd quæritur *ut jam factum* supponentes, ex quo antecedente hoc consequatur, expendimus; iterumque quodnam fuerit hujus antecedens; atque ita deinceps; usque, dum in hunc modum regredientes, in *aliquid jam cognitum*, locoque *principii* habitum, incidamus. Atque hic processus *Analysis* vocatur, quasi dicas (ἀναπαλιν λυσι) *Inversa Solutio.*

Quid sit  
Analysis, sive  
Resolutio.

“ E con-

Quid sit  
Synthesis, sive  
Compositio.

“E contrario autem, in *compositione* (ἢ συνθεσι,) cognitum illud in *resolutione* ultimo loco acquisitum, ut *jam factum* præmittentes, et quæ ibi consequentia erant, hinc ut antecedentia, naturali ordine disponentes, atque inter se conferentes, tandem ad *constructionem* quæsitæ pervenimus. Hoc autem vocamus *Synthesin*.

“Duplex autem est *analyseos* genus: vel enim est veri indagatrix, diciturque *Theoretica*, vel propositi investigatrix, ac *Problematica* vocatur. In *theoretico* autem genere, quod *queritur*, reverà ita se habere supponentes; ac deinde per ea quæ consequuntur, quasi vera sint, (ut sunt ex *hypothesi*,) argumentantes, ad evidentem aliquam conclusionem (ἐπὶ τι ὁμολογούμενον) præcedimus. Jam si conclusio illa vera sit, vera est quoque *propositio* de quâ *queritur*; ac demonstratio reciprocè respondet *analyysi*: si verò in *falſam* conclusionem incidamus, *falſum* quoque erit de quo *queritur*.

“In *problematico* verò genere, quod *proponitur*, ut *jam cognitum* sistentes, per ea quæ exinde consequuntur tanquam vera, perducimur ad conclusionem aliquam. Quòd si conclusio illa *possibilis* sit ac *πραγματι* (quod mathematici datum appellant) *possibile* quoque erit quod *proponitur*: Et hinc quoque demonstratio reciprocè respondet *analyysi*: si verò incidamus in conclusionem *impossibilem*, erit etià *problema impossibile*.

“*Diorismus* autem (διορισμός), sive *determinatio*, est quâ discernitur quibus conditionibus, et quot modis, problema effici potest. Atque hæc de *resolutione* et *compositione* dicta sunt.”

137. —“Verùm perpendendum est (notat *Halley*,) aliud esse problema *aliquatitèr* resolutum dare, quod modis variis plerùmque fieri potest; aliud, *metodo elegantissimâ* id efficere: *Analyſi* brevissimâ et simul perspicuâ; *Synthesi* concinnâ et minimè operosâ. Hoc veteres præstitisse, argumento est *Apolonii Liber De Sectione Rationis*.”

138. —“Ex his, credo, manifestum est (monet quoque *Newtonus*, *De Resolutione Quæſtionum Geometricarum*,) quid sibi velint *Geometræ*, cum jubent, ‘*putes factum esse quod queris*.’ Nullo enim inter cognitæ et incognitæ quantitates habito discrimine, *quælibet* ad ineundum calculum *assumere* potes, quasi omnes ex præviâ solutione essent notæ; et non ampliùs de *solutione problematis* sed de *probatione solutionis* ageretur.” —“Convenit ut fingas quæſtionem de *ejusmodi datis et quæſitis* propositam esse per quas arbitraris te posse ad æquationem *facillimè* pervenire.” —“Cum varios ordines quibus termini quæſtionis evolvi possint perspexeris, *E syntheticis quælibet adhibe* assumendo lineas tanquam *datas*, à quibus ad alias *facillimus videtur progressus*, et ad ipsas *vicissim difficillimus*.” —“Manuducit *analysis* ad *compositionem*: sed *compositio* non priùs verè sit, quam liberatur ab omni *analyſi*. Inſit *compositioni* vel minimum *analyseos*, et *compositionem* veram nondùm assecutus es. *Compositio* in se perfecta est, et à mixturâ *speculationum analyticarum* abhorret.”

Hæc

Hæc *Newtonus*, in "LIBRO" illo verè aureo, "DE COMPOSITIONE ET RESOLUTIONE," quem concinnavit, ut firmpior "*staret super vias antiquas*" *Juventus Britannica*; et quo meliùs obviàm iret pravæ isti novitati ex Scholâ *Cartesianâ* grassanti, quâ *Cartesius*, "mixturis speculationum *analyticarum*" nimis indulgendo, evidentiam et certitudinem *Geometriæ*, primus, obscurare et labefactare cœpit; et proinde, quasi per antithesin operi *Cartesiano*, cui nomen erat, per abusum, "GEOMETRIA:" Librum suum, *Newtonus*, titulo magis idoneo, ARITHMETICÆ UNIVERSALIS inscripsit.—Atque ad hunc librum, mole parvum, at pondere et subtilitate materiæ eximium ("cui forsàn secundum vix invenitur, nisi opus analyticum *Algebra Clairautiana*") interpretandum atque illustrandum, jamdudùm edebam ANALYS. ÆQUATIONUM, anno 1784. Vide *Prefat.* illius operis.

139. Methodum *Analyticam* et *Syntheticam* non solum in *Mathefi*, sed etiàm in *Mechanicâ Rationali*, optimè exponit *Newtonus*, sub finem *Opticorum*.

"As in *Mathematics*, so in *Natural Philosophy*, the investigation of *difficult* things by the Method of *Analysis*, ought ever to precede the Method of *Composition*."

"*This Analysis* consists in making *experiments* and *observations*, and in drawing *general conclusions* from them by *Induction*; and admitting of no *objections* against the conclusions, but such as are taken from *experiments* or other *certain truths*: for *hypotheses* are not to be regarded in EXPERIMENTAL PHILOSOPHY. And although the arguing from experiments and observations be *no demonstration* of general conclusions, yet it is the *best way* of arguing which the nature of things admits of, and may be looked-upon as so much the stronger, by how much the induction is more general: and if *no exception* occur from phenomena, the conclusion may be pronounced generally. But if, at any time afterwards, any exception shall occur from *experiments*, it may then begin to be pronounced with *such exceptions as occur*."

"By this way of *Analysis*, we may proceed from *Compounds* to *Ingredients*, and from *Motions* to the *Forces* producing them; and, in general, from *Effects* to their *Causes*; and from *particular* causes to *more general* ones, till the argument end in the most general:—this is the Method of *Analysis*."

"And the *Synthesis* consists in *assuming* the *Causes* discovered and established, as *Principles*; and by them *explaining* the *phenomena* proceeding from them, and *proving* the explanations."

And in the Preface to his PRINCIPIA, he gives the following elegant summary of this statement:—

"*Omnis enim PHILOSOPHIÆ difficultas in eo versari videtur, ut à phænomenis motuum investigemus Vires Naturæ; deinde, ab his viribus, demonstremus phænomena reliqua.*"

140. And he furnishes the following instances of his application of this method, in those two immortal works, his OPTICS and PRINCIPIA:

"In the two first books of these OPTICS, I proceeded, by *this Analysis*, to discover and prove the *original differences* of the RAYS OF LIGHT, in respect of *Refrangibility, Reflexibility, and Colour, &c.*—And these discoveries being *proved*, may be assumed, in the Method of *Composition*, for *explaining the phænomena* arising from them: an instance of which I gave in the end of the first book, [in the solution of the colours and figure of the *Rainbow*, from the refraction and reflexion of the Sun's rays in drops of falling rain.]

"In libro autem tertio [PRINCIPIORUM] exemplum hujus rei proposuimus per explicationem SYSTEMATIS MUNDANI: Ibi enim, ex *phænomenis cælestibus*, per propositiones in libris prioribus *mathematicè* demonstratas, derivantur *vires gravitatis*, quibus corpora ad Solem et Planetas singulos tendunt: deinde, ex *his viribus*, per propositiones etiàm *Mathematicas*, deducuntur motus *Planetarum, Cometarum, Lunæ et Maris.*"

141. And he expressly states that he adopted this method from the Ancients:—

"Cum VETERES *Mechanicam* [*Rationalem*, quæ per demonstrationes accuratè procedit,] (uti auctor est *Pappus*,) in rerum *naturalium* investigatione maximi fecerint; et RECENTIORES, *missis formis substantialibus, et qualitatibus occultis, phænomena NATURÆ* ad *leges mathematicas* revocare aggressi sint: *visum est in hoc tractatu MATHESIN excolere, quatenus ea ad PHILOSOPHIAM spectat.*"

How highly NEWTON admired the *Ancient Geometricians*, we learn from Dr. PEMBERTON:—

"He often censured the handling of *Geometrical* subjects by *Algebraïck* calculations; and his Book of Algebra he called by the name of *Arithmetica Universalis*, in opposition to the injudicious title of *Geometry*, which DES CARTES had given to the Treatise in which he shews how the Geometrician may assist his invention by such kind of computations. He frequently praised SLUSIUS, BARROW, and HUYGENS for not being influenced by the *false taste* which then began to prevail: he used to recommend the laudable attempt of HUGO D'OMERIQUE to restore the *Ancient Analysis*; and very much esteemed APOLLONIUS's book *De Sectione Rationis*, for giving us a clearer notion of that Analysis than we had before. Dr. BARROW may be esteemed as having shewn a compass of *invention* equal, if not superiour, to any of the *Moderns*, our Author only excepted: but  
NEWTON

NEWTON particularly recommended HUYGENS's style and manner; he thought him *the most elegant of any mathematical writer of modern times, and the truest imitator of the Ancients*. Of *their* taste and mode of demonstration our Author always professed himself a great admirer; and even censured himself for not following them yet more closely than he did: and spoke with regret of his mistake, at the beginning of his Mathematical Studies, in applying himself to DES CARTES and other *Algebräick* writers, before he had considered *the Elements* of EUCLID with that attention which so excellent a writer deserves."

Absolutis hætenùs VINDICIIS NEWTONIANIS, quatenùs *Elementa Metaphysica et Principia Mathematica* respiciunt, (quibus fundantur opera ejus eximia Analytica et Philosophica) adversùs objectiones Gallorum, Germanorum, Anglorumque, horum evidentiam et certitudinem, aut malignè, aut imperitè, aut oscitantèr, insectantium; superest altera et acrior cura, ut repellatur crimen multo gravius, "*facinusque majoris abolla*," quasi PHILOSOPHIÆ atque THEOLOGIÆ cultor ille, omnium modestissimus et sanissimus, fuisset et ipse fautor dogmatis pravissimi atque turpissimi quod *Materialismum* vocant, Naturam *Mentis Humanae* merè mechanicam statuentis, et "*divinae particulam auræ*," (etiàm ab antiquissimis agnitæ,) extinguere gestientis; ipsum NUMEN SUMMUM—OPTIMUM, SAPIENTISSIMUM, MAXIMUM et POTENTISSIMUM omnium, quasi *Animam Mundi, Ætheream*, pro nefas! absurdè et impiè fingentis, et deliramenta "*insanientis sapientiæ*," iterùm recoquentis, per Philosophiam pravam et Mythologiam *Leibnitzianam*, gravissimòsque errores inde prognatos; hoc *seculum rationis* (ut dicitur) infausto, *Revelationem* aspernante.

## APPENDIX II.

---

### DE ÆTHERE VIBRATORIO.

“CE grand homme (NEWTON) voyoit à travers d'un voile, ce qu'un autre ne distingue qu'à peine avec un Microscope!” DAN. BERNOULLI\*.

142. Nuper, cum perlegerim opus eximium, perutile, tempestivum, à viris bonis ubique laudatum,—“*Proofs of a Conspiracy against all the Religions and Governments of Europe, &c.* by John Robison, A. M. Professor of Natural Philosophy, &c. Edinburgh,”—incidi in censuram haud levem *Patris Philosophiæ Britannicæ*, p. 483.

“Were it possible for the departed soul of *Newton* to feel pain, he would surely recollect with regret that *unhappy hour*, when, provoked by *Dr. Hooke's* charge of plagiarism, he first threw out his *whim* of a *Vibrating Æther*; to shew what might be made of an *Hypothesis*: (for *Sir Isaac Newton* must be allowed to have paved the way for much of the *Atomical Philosophy* of the Moderns.) *Newton's Æther* is assumed as a *fac totum* by every *precipitate sciolist*, who, in despite of logic, and in contradiction to all principles of mechanics, gives us *theories* of *muscular motion*, of *animal sensation*, and even of *intelligence* and *volition*, by the *undulations of ætherial fluids*.

“Not one of a hundred of these *theorists* can go through the fundamental theorem of all this doctrine, (the 47th *Prop.* of the *Second Book of the PRINCIPIA*); and not one of a thousand know that *Newton's* investigation is *inconclusive*:—yet they talk of the effects and modifications of those undulations as familiarly as if they could demonstrate the propositions in *Euclid's Elements*.”

Talis viri ictus, PHYSICAM excolentis, et NEWTONUM quasi præceptorem adamare profitentis, acerbius lædunt: Antifitii ipsi scientiarum venerando,

\* Vide Note (c). posthæc.

annon exclamare fas sit, jamdudùm hujusmodi crimina auscultanti:—"Si id *Cinerem* aut *Manes* credis curare sepultos (a)."

—"Pol, me occidistis AMICI!—

Obe jam satis est!—Et TU, BRUTE!!!—

*Telum imbellè jacis; imò, tuum in cerebrum facilè retorquendum, vibranti medium transverberans istu.*"

143. Plusquàm viginti retrò annis, Disquisitionem edebam, anno 1778, *Dublin*, *De Sonis* et *De Modificationibus Atmosphære*, secundùm Theoriam *Newtonianam*,—primitias Studiorum meorum Philosophicorum,—dum, apud Academicos *Dublinenses*, Socius degerem. Et, cum ista disquisitio forsàn nondum ad manus pervenerit Professoris *Robison*, me operam vel illi viro clarissimo deque Republicâ optimè merenti, haud ingratam impensurum spero, si exinde pauca excerpserim, hanc rem spectantia.

Primo igitur in limine, monendus est, *Newtonum*, haudquaquam "*opinionum*" seu *hypotheseon* vanarum studiosum, nec novum neque inauditum "*commentum*" de "*æthere* quodam *vibratorio*" finxisse; sed vetustum omninò, atque à philosophis sanioribus receptum: § 42.

*Zeno*, audiendi facultatem irà exponit, *Laert. Lib. 7. § 158*.—*Ακρῆν δὲ, τὴ μεταξὺ τῆ τε Φωνῆς καὶ τῆ ακροῆς, αἶρος πλεττομένη σφαιροειδῶς, εἴτα κυματῶμενα, καὶ ταῖς ἀκοαῖς προσπιπτοντος ὥς κυματῶται τὸ ἐν τῇ δεξαμένῃ ὕδωρ, κατὰ κυκλῶς, ὅπου, τὴ ἐμβληθέντος λίθου.*

"*Auditus* fit, ubi aer inter loquentem audientemque interpositus, pulsatur *sphæricè*; deinde undulatur, auribusque impingit: sicuti undulatur *aqua* in cisternâ, secundùm circulos, injecto lapide."

(a) Quantum à disputationibus controversiisque abhorruit mite *Newtoni* ingenium, constabit ex *Epistolâ ejus ad Oldenburgh*, Oct. 24, 1676.

—"Five years ago, (1671,) when, at the persuasion of my friends, I had resolved to publish a Treatise of the *Refraction of Light and Colours*, which I had then by me; I began again to turn my thoughts to these *Serieses* [for determining the Areas of Curves]; and wrote likewise a Treatise upon them, that I might publish both together.—But having wrote you a letter upon the *Reflecting Telescope*, in which I explained briefly my notions on the *Nature of Light*, something unexpected fell out, which made me imagine it concerned me to write to you speedily about priating that Letter. Immediately upon the back of this, I met with frequent interruptions from several persons' letters, taken up with *objections*, and other things, which frighed me entirely from executing my design; and made me find fault with myself for my imprudence—that, by catching at a *shadow*, I had been so far deprived of the peace and quiet of my own mind; which is a thing of more substantial worth."

At last *Newton* found out an expedient that rid him of much of this troublesome and teasing correspondence: when objections were stated against the accuracy or validity of his *Optical* experiments, he simply replied—"I doubt the fact;"—"repeat the experiment,"—instead of entering into any discussion or vindication about his own.

*Diogenes*

*Diogenis* atque *Platonis* placita quoque, sic refert *Plutarchus*, *De Placit. Philos.* Lib. 4. cap. 16.—*Διογενης, τε εν τη κεφαλη αερος υπο της Φωνης τυπ/ομενε και κινε/μενε· Πλατων, και οι απ' αυτε, πωλη/εσθαι τον εν τη κεφαλη αερα, τε/ον δε ανακλασθαι εις τα ηγεμονικα, και γινεσθαι της ακοης την αισθησιν.*

“*Diogeni* [placet hoc effici] aëre intrà caput à voce pulsato atque commoto. *Platoni*, ejúsque sequacibus, aërem intrà caput pulsari, deinde ad partes *imperatorias* reflecti; atque hoc pacto sensum auditùs fieri.”

*Lucretius* quoque phænomena *Lucis* et *Sonorum* disertè confert: *Lib. 4.*

“Quod superest, non est mirandum quâ ratione,  
Quæ loca per, nequeunt oculi res cernere apertas;  
Hæc loca per, voces veniant auréisque laceſſant.  
Conloquimur clausis foribus, quod sæpe videmus:  
Nimirum, quia vox per flexa foramina rerum  
Incolumis transire potest; simulacra renutant;  
Perſcindunt enim, nisi recta foramina tranant,  
Qualia sunt vitri, species quâ travolat omnis.  
Præterea, partes in cunctas dividitur vox;  
Ex aliis aliæ quoniam gignuntur, ubi una  
Diffiluit semel in multas exorta: (quasi ignis  
Sæpe solet ſcintilla suos se ſpargere in ignes);  
Ergo replentur loca vocibus, abdita retrò,  
Omnia quæ circum fuerint, sonitûque cientur:  
At simulacra viis directis omnia tendunt,  
Ut sunt missa semel; quapropter cernere nemo  
Se suprâ potis est, at voces accipere extrâ.”

Atqui hîc habes quasi seminarium totius *Doctrinæ Sonorum*, rationalis et experimentalis, in difficillimâ parte difficillimi operis, nempe, in *Sectione oëtaυδ*, *Lib. 2. Princip.* “*De Motu per fluida propagato* expōitæ et demonstratæ.”

144. Haudquaquàm patitur hujus instituti ratio, de *Doctrinâ subtilissimâ* Pulſuum et *Vibrationum Aëris*, seu *Medii Ætherei*, jam differere, quæ vel mathematicè doctos non parùm morantur; accuratiùs autem exponitur fusiùsque illustratur tota hæc doctrina, in *Disquisitione prædictâ De Sonis*.

Unam saltèm observationem inde depromere non pigebit, p. 139, *de veritate propositionis illius fundamentalis 47*, à Professore *Robison* denegatæ:

“*Le Saur* et *Jacquier* veritatem propositionis deducunt ex vibrationibus partium *chordæ elasticæ*, quæ peraguntur viribus in ratione distantiarum à medio vibrationum loco: sed singulæ aëris particulæ motum chordæ *mutuantur* successivè: ergo, instar chordæ ipsius, *moventur* viribus, &c.—At hæret deductio

L.

nisi.

nisi ostendere possent, *omnia corpora* sonitum edentia *legem chordæ elasticæ* in tremoribus suis servare, [*aëremque* similiter agitari].

“*Rowning, Nat. Phil. Part 2. p. 48, veritatem propositionis immediate deducit ex lege repulsivâ partium aëris:—*Nam particula quævis, pressione partium à tergo, versùs particulas antecedentes propelletur viribus quæ sunt ut intervalla centrorum reciproce: atque adeò, ut distantia hujus particulæ à primo suo loco directè.”

Ex hac lege *vis elasticæ* seu *repulsivæ*, (quæ à *Newtono* mathematicè demonstratur, *Prop. 23. Lib. 2. Princip. et experimentis confirmatur, § 4, De Sonis*), elicitur conclusio, *Quod singule fluidi elastici tremuli particule, motu reciproco brevissimo euntes et redeuntes, accelerantur semper et retardantur in ratione distantiarum à medio vibrationum loco: hoc est, pro lege penduli in cyclo-eide oscillantis.*

145. Demonstratio *Newtoniana*, quâ instituitur analogia hæc elegantissima inter *vibrationes aëris* et *oscillationes penduli*, longè subtilissima, est prorsus analytica, ex ipsis fontibus *ANALYSIS ANTIQUÆ* hausta:

“*Fingamus medium [elasticum] tali motu [vibratorio] à causâ quâcunque cieri; et videamus quid inde consequatur, &c.*”

Propositionis autem 47 ipsa conclusio, “*Aërem, pulsibus per medium elasticum propagatis, cieri seu agitari pro lege oscillantis penduli,*” abundè confirmatur experimentis de variis sonorum generibus, tormentorum dispoſitionibus, &c. factis ad investigandam *velocitatem sonorum*, (seu rationem secundum quam rectâ progrediuntur), in *ITALIA*, observantibus Academicis *Florentinis*; in *ANGLIA*, observantibus *Newtono, Derbamo, &c.*; in *AMERICA AUSTRALI*, observantibus Academicis *Gallis* atque *Hispanis*; et nupèr etiâ in *AFRICA*, propè ostium *Nili*, victoriâ illâ insigni navali apud Sinum *Aboukir*, Aug. 1, 1798, à classe Anglicâ sub imperio ducis magnanimi Horatii Nelson, de classe Reipublicæ Gallicæ reportatâ; ubi fragor navis *L'Orient*, explosæ, *Roset'am* pertingebat, iusto post fulgorem visum intervallo temporis, ratione habitâ distantia et fluxûs uniformis sonorum (b).

(b) Si observationibus *M. Poussielgue, Gallorûmque* adstantium, tempore illo trepidationis bellicæ iniquo et infauſto, fides est adhibenda, fragor navis *L'Orient*, in sinu *Aboukeriano* explosione combustæ, stationem suam apud *Rosetiam* pertingebat tempore *duorum minutorum primorum* post fulgorem visum. At propagatur sonus mediâ velocitate 1142 pedum circitèr, tempore unius minuti secundi, et proinde 13 milliarius Anglicorum tempore unius minuti primi. Distabant igitur *Galli* 26 milliaria Anglica à loco explosionis, *ad minimum*, recto cursu.

Augenda est enim hæc distantia, ob *calores æstivos* istius regionis, in ratione 1142, seu potius pedum Gallicorum 1070 ad 1101; sicut pedum Gallicorum 1101, singulis minutis secundis, determinabatur velocitas sonorum ad insulam *Cayenne*; (intervallo 20230 hisapedarum (*toises*), seu milliarius Anglicorum 25 ferè, geometricè mensurato à *Condamine* Academicisque Gallis; atque adeò accuratè ut, ex quinque experimentis factis per tormentorum explosiones, quatuor vix uno semi-secundo temporis ab invicem discrepârunt. Distantia igitur, hac ratione aucta, correctior emerget milliarius 27 ferè. Atque iterum forsàn augenda est, ob ingentem fragorem navis explosæ, intensissimos tremores, eodémque forsàn principio latissimos, excitantis. Academicorum *Anglorum* certè æquum foret rem determinare, geometricè mensurando distantiam stationis apud *Rosetiam*, à nave *L'Orient*; ad perficiendam aut corrigendam Theoriam *Newtonianam*, experimento adeò illustri, minimè negligendo,

Consensus igitur theoriæ cum experimentis fideliter institutis ubicunque regionum satis confirmat. *Analyfin Newtonianam* ritè institutam fuisse; nam *veritas conclusionis infert veritatem præmissorum*.—Vide *De Sonis*, § 47; ubi datur Tabula Observationum *Florentinorum*, &c.; necnon *Append.* p. 71; ubi demonstrationes harum propositionum valdè difficillium, 47 et 49, plenius exhibentur; atque notis illustrantur.

146. Nec est cur de *Æthere Vibratorio* cavillationes excitentur:—vox *æther* à Newtono usurpatur pro *aëre purissimo*, *vaporibus* sordibusque heterogeneis defæcato:—"hi enim, (cum sint alterius elateris et alterius toni,) vix, et ne vix quidè, participant motum *aëris veri* quo soni propagantur." *Princip.* p. 373.

Hunc *ætherem*, seu *medium æthereum*, ingenti elatere (seu elasticitate) esse præditum, docet *Newtonus*, *Optics*, p. 325, his verbis:

"That the *elastic force* of this medium is exceeding great, may be gathered from the swiftness of it's vibrations; *sounds* move about 1140 English feet in a second of time, and in 7 or 8 minutes of time they move about 100 English miles: *Light* moves from the Sun to us in about 7 or 8 minutes of time; which distance (supposing the Sun's horizontal parallax to be about 12'') is about 70 millions of English miles; and by consequence, above 700,000 times swifter than sounds: and therefore the elastic force of this medium must be above 490,000 million of times greater than the elastic force of the air [at the earth's surface]"—in proportion to their respective rarities (c).

147. The astonishing *rarefaction* of which the air is capable is remarked, *Optics*, p. 341, from experiment and from computation:

"Mr. *Boyle* has shewn that air may be rarefied about 10,000 times in vessels of glass; and the heavens are much emptier of air than any *vacuum* we can make below. For, since the air is compressed by the weight of the incumbent atmosphere, and the density of the air is proportional (or it's rarity reciprocally proportional) to the force compressing it, it follows, by computation, [*Princip. Lib. 2. Prop. 22. Cor. et De Sonis*, § 14.] that, at the height of about  $7\frac{1}{2}$  English miles from the earth, the air is 4 times rarer than at the surface of the earth; and at the heights of  $22\frac{1}{2}$ , 30, or 38 miles, it is respectively 64, 256, or 1024 times rarer, or thereabouts; and at the height of 76, 152, 228 miles, it

(c) *Newton, Principia*, p. 405, estimates the Sun's horizontal parallax, lower, at  $10\frac{1}{2}'$ .—And the calculations made since the Transit of Venus in 1761, reduce it further to  $8''.6$ ; which will enlarge the Sun's distance from us to upwards of 95 millions of miles; and consequently raise the proportion of the elastic force of the ætherial medium to upwards of 900,000 million times greater than that of our air.

The calculation depends on the velocities of the pulses (or propagation of the vibrations) of elastic fluids being in a compound subduplicate ratio of their elasticities and rarities. *Princip.* II. 49. *Cor. 2.*

is about a million, a billion, or a trillion, times rarer; and so on:" infomuch that, in the *Principia*, p. 512, *Newton* computes, that "a globe of our air one inch in diameter, at the elevation of one semidiameter of the earth (about 4000 miles), would, by it's expansive power, fill all the planetary regions, far beyond the orbit of *Saturn*."

148. Non temère igitur conjicit *Newtonus*, *Princip.* p. 530—"De spiritu quodam subtilissimo corpora crassa pervadente, et in iisdem latente; cujus vi et actionibus particulæ corporum ad minimas distantias se mutuò attrahant; et contiguæ factæ, coherant; et corpora electrica agunt ad distantias majores, tam repellendo quàm attrahendo corpuscula vicina; et lux emittitur, reflectitur, refringitur, inflectitur et corpora calefacit; et sensatio omnis excitatur, et membra animalium ad voluntatem moventur: vibrationibus scilicet bujus spiritus, per solida nervorum capillamenta ab externis sensuum organis ad cerebrum, et à cerebro in musculos, propagatis."

149. Fusiùs hæc exponit, *Optical Queries*:

"Is not animal motion performed by the power of this [ætherial] medium, excited in the brain by the power of the will, and propagated from thence through the solid, pellucid, and uniform, capillamenta [or minute fibres] of the nerves into the muscles for contracting and dilating them?"—Vide § 195.

[N. B.] "I suppose that the capillamenta of the nerves are each of them solid and uniform, that the vibrating motion of the ætherial medium may be propagated along them from one end to the other uniformly and without interruption (for obstructions in the nerves create palsies): and that they may be sufficiently uniform, I suppose them to be pellucid when viewed singly, though the reflexions in their cylindrical surfaces may make the whole nerve, composed of many capillamenta, appear opaque and white."

Cautissimè igitur distinguit *Newtonus* his locis, inter mechanicas operationes fluidi hujusce ætherei seu "*spiritus subtilissimi*"—et mentem ipsam seu voluntatem, quæ hæc sentit, et quodam modo nobis prorsus incognito, dirigit.

150. Et quàm sollicitè distinguit quoque inter modificationes corporum, et sensationes quas in mente excitant! in *Optics*, p. 108.

"If at any time I speak of light and rays as coloured or endued with colours, I would be understood to speak not philosophically and properly, but grossly, and according to such conceptions as vulgar people, in seeing all these experiments, would be apt to frame. For the rays, to speak properly, are not coloured: in them there is nothing else but a certain power and disposition to stir up a sensation of this or that colour: for as sound in a bell or musical string, or other sounding body, is nothing but a trembling motion; and in the air is nothing but

but that motion *propagated* from the object; and in the *sensorium* 'tis a *sense* of that motion under the form of *sound*: so COLOURS in the *object* are nothing but a *disposition* to *reflect* this or that sort of rays more copiously than the rest; in the *rays*, they are nothing but their *dispositions to propagate* this or that motion into the *sensorium*; and in the *sensorium*, they are sensations of those motions under the forms of *colours*."

---

DE SENSORIO ET DE VI SENTIENDI.

---

151. QUANTAS tragedias excitavit hæc vox technica *sensorium*! Reclamant *Leibnitziani*: "*Newtonum* hîc habes reum confitentem, et vim sentiendi omnem ex causis *mechanicis* solventem!"

Sed ipsum audiamus, de industriâ definientem hanc vocem, "*the place of sensation*."

"Is not the *sensory* of animals that *place* to which the sensitive substance is present, and into which the sensible species of things are carried through the nerves and brain; that there they might be *perceived* by their immediate presence to *that substance*?"

And this distinction between the *organs of sensation* and the *sensitive substance* itself was long ago noticed by *Socrates*, in the *Phædo* of *Plato*, thus ridiculing the *Mechanical Philosophists* of his day:

"It is true indeed, that without *bones* and *nerves*, and such other *organs* as I possess, it would be impossible to *act* as I thought fit; but to assert that I do what I do by their *agency*, and not from *choice* of the best, would be downright absurdity, and a mode of argument truly ridiculous."—Thus nobly stating his decided choice, rather to remain, and submit to the unjust sentence of the *Athenian Judges*, than to save his life by escaping to *Megara*, and seeking an asylum among the *Bæotians*.

But was this preference merely the result of *vibratiuncule* of the brain?

De industriâ itêm monet *Newtonus*, ne perperam intelligatur *conjectura* sua sagacissima de modo sentiendi;—se nullatenus *theoriam* proponere: *Princip. fine*.

"Sed hæc *paucis* exponi non possunt; neque adest *sufficiens copia experimentorum* quibus *leges* actionum hujus *spiritus* [*ætheris*] accuratè determinari et monstrari debent."

152. Con-

152. Conjecturæ *Newtonianæ* de actionibus hujusce *spiritûs*, seu *fluidi electrici*, ad stipulari fas sit, recitando phænomena quædam, quæ mihi ipsi obtigerunt abhinc circiter decennio; necnon viro clarissimo *Maclaurin*, moribundo; quæ satis confirmare videntur *existentiam talis spiritûs in ipsis cerebri penetralibus ætèr latentis, et functionibus animi rectoris peragendis apprime forsàn necessariis*; intimo quodam et incomprehensibili nexu inter *volitiones* et *actiones* subsistente, mediantibus organis corporeis. Nam, secundùm *Locke*:

“It may seem probable, that the *constitution* of the body does *sometimes* influence the *memory*; since we *sometimes* find a *disease* quite strip the mind of all it's *ideas*, and the flames of a *fever* in a few days calcine all those *images* to dust and confusion, which seemed to be as lasting, as if graved in marble.”—*Essay*, Book II. c. 10.—See also § 195.

153. Æstate anni 1789, ipse in *febrem biliosam* incidi, ex diutinis laboribus, assiduâ studiis, nimisq; curis contractam. Et quùm febricus infomnio miserè laborarem, medicus quidam ex peritioribus, mihiq; amicus, *laudani* liquidi potionem administrabat, ad reducendum somnum. At spem prorsùs fefellit: licèt enim potio bis terve repeteretur, manebat infomnium; et, quod notatu dignissimum est, unaquâque vice, decem circiter minutis temporis post potionem hautam, phænomenon singulare occurrebat: *quasi scintillæ ignis affatim effluerunt ex oculis meis, velut idu percitis*. Me ipso igitur deprecante, intermissa est potio.—Exinde autèm valetudine ægerrimâ afflictus sum; affectionibus nervosis, et capitis leato dolore potissimùm, per triennium; obstructis quasi viribus animi;—inutilis mihi, inutilis propinquis et amicis, inutilis reipublicæ, *ετιωσιον αχθου αρετης*.

Tandèm in plenitudine temporis atque mœroris, ubi cernere erat indicia hæd obscura *paralyseos* jamjam imminentis, opitulatus est *MEDICUS SUMMUS*—*Ἦ γὰρ ΔΥΝΑΜΙΣ αὐτῆς ἐν ΑΣΘΕΝΕΙΑ τελεῖται*.—Mihi enîm suggestit *ILLE DEUS*, ut ex desidiâ ferè continuâ me extricarem, et ambulando strenuè me exercerem ad sudorem usque, si quâ ratione ciceretur defluxio à cerebro, quod onere quasi incumbente valdè erat oppressum; et longè ultrà expectationem fuit successus: nam in fine hebdomadis unius tali exercitio occupatæ, sex aut septem horis per diem, defluxio humoris lymphatici, seu aquei, subitò erupit, cum admodùm incallescere ambulando, et quasi à vertice ipso onus incumbens sublatum est, humore per glandes maxillares abundè stillante in os; et in fine hebdomadis alterius, gradatim exsiccatâ defluxione, ad perfectam integrâmq; valetudinem restitutus sum; et meliorem quidèm quam per viginti antè annos. Diffugère febres; redii ad me-ipsum, redii ad studia diù intermissa, redditus sum propinquis amicisq; redditus patriæ—Iterùm mihi concessa est, per misericordiam divinam, *Mens sana in corpore sano*.

DEO OPTIMO MAXIMO LAUS! *Luc. xvii. 18.*

154. Re-

154. Recolebam febriens isto tempore, huiusmodi phænomenon, vel eidem valde simile, viro clarissimo *Maclaurin* obtigisse moribundo; et inde erat quod averfatus atque deprecatus sum, quasi infaustum et malè ominatum foret, portionem illam *laudani*, quæ id manifestò excitaverat; vaporibus forsàn *laudani*, (ut postea suspicatus sum), à stomacho calido dissolutis, (qui, utpote valde biliosus, actionem *laudani* tunc respuebat,) et inde ascendentibus in cerebrum; et ignem electricum ibi latentem expellentibus per nervos opticos; vaporibus ipsi in aquam postea conversis.

Casus *Maclaurini* ità describitur à biographo optimo:

—"His behaviour, during this tedious and painful distemper—[a *dropfy* of the belly, for which he had been thrice tapped]—was such as became a PHILOSOPHER and a CHRISTIAN, calm, chearful and resigned: his *senses* and *judgment* remaining in their full vigour, till within a few hours of his death. Then, for the first time, his *Amanuensis*, to whom he was dictating the last Chapter of the following work, [An Account of Sir *Isaac Newton's* Philosophical Discoveries,] (in which he proves the wisdom, the power, goodness, and other attributes of the DEITY,) observed some hesitation or repetition: no *pulse* could then be felt in any part of his body; and his hands and feet were already cold. Notwithstanding this extremely weak condition, he sate in his chair, and spoke to his friend Dr. *Munro*, with his usual serenity and strength of reason; desiring the Doctor to account for a *phænomenon* which he then observed in himself; *flashes of fire seemed to dart from his eyes; while, in the mean time, his sight was failing, so that he scarce could distinguish one object from another.*—In a little time after this conversation, he desired to be laid upon his bed; where, on Saturday the 14th of June, 1746, aged 48 years and four months, he had an *easy passage* (\*) from this world to that state of blifs, which he had the most elevated ideas of, and which he most ardently longed to possess."

"Let ME die the death of THE RIGHTEOUS;  
And let MY last end be like HIS!!"

*Mac-*

*Maclaurin's Last Words.*

155. THE concluding, unfinished paragraph of that sublime Discourse is too curious in the *History of Man*, too precious to the *Christian Philosopher*, to be withheld on this occasion:—

—“As MAN is undoubtedly the *chief being* upon this globe; and *this globe* may be no less considerable in the most valuable respects than any other in the *solar system*; and *this system*, for aught we know, not inferior to any in the UNIVERSAL SYSTEM: So, if we suppose *Man* to *perish*, without ever arriving at a more competent knowledge of NATURE, than the *very imperfect* one he attains in his *present state*, by *analogy* (d) (or parity of reason), we might conclude, that the *like desires* would be frustrated in the *inhabitants* of all the other *planets* and *systems*; and that the *beautiful scheme* of NATURE would never be unfolded, but in an exceedingly imperfect manner, to *any* of them:—This, therefore, naturally leads us to consider our *present state*,—as only *the dawn* or *beginning of our existence*; and as a state of *preparation* or *probation*, for farther advancement: which appears to have been the opinion of the *most judicious Philosophers* of old. [See *Heb. xi. 13—16.* and Note (e).]

“And

(d) It was a maxim, recorded of *Hermes*, and ascribed to the primitive *Chaldean* or *Persian Magi* (the established priesthood of the Babylonish and Persian Empire)—

Συμπᾶσι εἶναι τὰ ἀνω τοῖς κατω.

“That *what passes in the heavens above is analogous to what passes on earth below.*”

But this sage maxim, like many others, derived from *patriarchal wisdom*, in process of time was much abused by succeeding corrupt *poets* and degenerate *philosophers*, receding from the native purity and simplicity of Revelation, and impiously attributing *human passions* to *celestial beings*. See § 169.

(e) The following curious and valuable anecdote we owe to Professor *Robison*, p. 236:—

“*Daniel Bernoulli*, the most elegant mathematician, the only philosopher and the most worthy man of that celebrated family, said to a gentleman (*Dr. Staebeling*), who repeated it to me, that *when* reading some of those *wonderful guesses* of *Sir Isaac Newton*, the subsequent demonstration of which has been the chief source of fame to his most celebrated commentators,—his *mind* has sometimes been so overpowered by *thrilling emotions*, that he has wished that moment to be his last; and that it was *this* which gave him the *clearest conception of the happiness of heaven.*”

And should not these “*thrilling emotions*,” to which, I am persuaded, Professor *Robison* is no stranger, induce him to treat the Doctrine of a “*Vibrating Ether*” with more respect, so widely removed from “a *whim* made out of an *hypothesis*,” by *Newton’s* ingenuity?—Should he not rather rank it among the most profound of his *wonderful guesses*,—approaching very nearly to the dignity of a *theory*, founded on such *experiments* as the preceding?—How otherwise, are we to account for such *thrilling emotions* of ecstatic delight? such *convulsive horrors* of agonizing fear? such strange effects, as the change of the colour of the hair of a condemned criminal *from black to white* in the course of a single night? such fatal and deadly disruptions of the *material vehicle*, as are produced by sudden

and

“ And whoever attentively considers THE CONSTITUTION OF HUMAN NATURE, particularly the *desires* and *passions* of men, (which are *greatly superior* to their present objects,) will easily be persuaded, that MAN was *designed* for *higher* views than those of this life: these, the AUTHOR OF NATURE may have in reserve; to be opened-up to us at *proper periods* of time, and after *due preparation*: surely it is in HIS power to grant us a much greater *improvement* of the faculties we already possess; or even to endow us with *new* faculties (of which at this time we have no idea) for penetrating farther into the SCHEME OF NATURE, and approaching nearer to HIMSELF—THE FIRST AND SUPREME CAUSE:—We know not how far it was proper or necessary, that we should not be let into knowledge *at once*, but should advance *gradually*; that, by comparing new objects or new discoveries with what was known to us before, our improvement might be more compleat and regular: or how far it may be necessary or advantageous that INTELLECTUAL BEINGS should pass through a kind of *infancy of knowledge*; for new knowledge does not consist so much in our having access to a new object, as in comparing it with others already known; observing its *relations* to them (or discerning what it has in

and overpowering transports of joy or grief?—These are notorious *effects*: and how they are to be accounted for, upon attentive consideration of the *constitution of human nature*, composed of a *mind* operating upon its receptacle or *sensorium*, otherwise than by some inconceivable *stimulus* of the nervous system, conveyed through *muscular vibrations*, or some *impulse* analogous thereto, I leave to his ingenuity to suggest.

2. To the taste and piety of Professor Robison (whom I hail as a *Brother*, notwithstanding our disagreement in one instance,) we are also indebted for circulating in his deservedly popular work, *Mason's Sacred Ode*, drawn from the purest sources of the *Pierian Spring*:

“ Think not THE MUSE whose *sober* voice you hear,  
Contracts with *bigot* frown her sullen brow;  
Casts round RELIGION's orb the mists of *fear*,  
Or shades with horror, what with *smiles* should glow:

No.—SHE would warm you with *seraphic fire*;  
Heirs as you are of HEAVEN's eternal day;—  
Would bid you *boldly* to THAT HEAVEN *aspire*,  
Not *sink* and *slumber* in yon cells of clay!—

Is this the *bigot's* rant?—Away, ye *vain*!  
Your doubts, your fears, in *gloomy dulness* sleep:  
Go!—*foot*be your souls in sickness, death, or pain,  
With the *sad solace* of eternal sleep!

Yet know, *vain sceptic*! know, th' ALMIGHTY MIND,  
Who breath'd on *Man* a portion of HIS fire;  
Bade his *free soul*—by earth nor time confin'd—  
To HEAVEN; to IMMORTALITY; *aspire*!

Nor shall this *pile of hope*, HIS BOUNTY rear'd,  
By *vain Philosophy* be e'er destroyed;  
ETERNITY, by ALL or *hop'd* or *fear'd*,  
Shall be by ALL or *suffer'd* or *enjoy'd*.”

M

common

common with them), and wherein their *disparity* consists. Thus, our knowledge is vastly greater than *the sum* of what all its objects separately could afford; and when a *new* object comes within our reach, the addition to our knowledge is the greater, the more we already know: so that it increases, not as the new objects increase, but in a *much higher proportion*." \* \* \*

156. And was the exalted *mind*, that reasoned thus powerfully, and triumphed over *bodily* infirmity in the very jaws of *death, material*?—Was all this merely the result of corporeal *mechanism*? Was the profound process of this noble argument for the survival and improvement of the soul; the grand *climax* at the beginning, rising from this globe to the milky way; such clear-sighted intelligence of the master principles and lofty affections, and aspiring views of *human nature*, in the sequel; such subtle and abstruse analysis of the doctrine of *combinations* and of the *fluxionary* calculus, applied at its unfinished close; such humble, yet astonishing penetration and insight into the mysterious ways of Providence, in this life—"Looking thro' NATURE up to NATURE'S GOD:"—while the quivering lamp of light, thus darting the brightest flashes of celestial fire, was expiring in the socket.—Was all this admirable assemblage, of the pious and the profound, the sublime and the beautiful, the argumentative and the eloquent, no other, ye *Hartleys*! ye *Priestleys*! ye *Condorcets*! ye *Godwins*! or ye *Darwins*! than mere animal mechanism? wrought and effected, wholly and solely, by *vibratiuncule* or minute tremors of the *pulpy* substance of the brain!!! (f)

"O curvæ in terras animæ et cœlestium inanes!  
Quid juvat hoc, templis nostros immittere mores;  
Et Bona Dis ex hac sceleratâ ducere pulpâ?"

PERSIUS.

D'Allem-

(f) The sublime Philosophy of HOLY WRIT, and that alone, has *authoritatively* decided the mysterious and momentous questions of the *immateriality* of the *Soul*, of its natural *mortality*, and of its *reunion* with an *incorruptible body* after death; recording the *Origin* and the *End* of the *Human Race*:—

1. "THE LORD OF GODS formed the Man, dust of the ground,  
And breathed into his nostrils, *breath of life*;  
So Man became a *living soul*." Gen. ii. 7.
2. "Dust thou art, and unto dust shalt thou return." Gen. iii. 19.
3. "All *Flesh* shall perish together;  
And Man shall turn again unto dust." Job xxxiv. 15.
4. "I know that my DELIVERER is LIVING;  
And at the *last* [day] will arise [in judgment] upon dust:  
Yet, after this *skin* be mangled,  
Even in my *flesh* shall I perceive GOD;  
Whom I shall perceive, *on my beds*,  
And mine eyes shall see [HIM] *not estranged*." Job xix. 25.

5. "The

*D'Alembert's Mournful Reflections.*

157. As a terrific contrast to the death of the *Christian Philosopher*, I shall propose the dreadful gloom that overhung the latter days of a *philosophizing infidel*, furnished by his correspondence with the King of *Prussia*, another of the original conspirators against Christianity in the train of *Voltaire*.—*D'Alembert*.—at once the glory and disgrace of the French *Academy of Sciences*—“*deceiving*” others, by his perfidious sophistry, but not fully “*deceived*” himself—so as to conquer and blunt the stings of remorse, and the terrors of a guilty conscience, anticipating “the just reward” of those fiends in human form, who,

5. “The *dust* shall return to the *earth* as it was;  
But the *spirit* shall return to God who gave it.” *Ecclef. xii. 7.*
6. “JESUS CHRIST—“illustrated *life* and *incorruption*.” *2 Tim. i. 10.*  
“Himself—“the *first fruits* of the *sleepers*.” *1 Cor. xv. 20.*
7. “Lo! I tell you a *mystery* :  
We shall not all *sleep*, but we shall all be *changed* ;  
In a moment, in the twinkling of an eye,  
At the *last trumpet*.”——
8. “For this *corruptible* (body) must put on *incorruption* ;  
And this *mortal* (spirit) must put on *immortality*.”
9. “O *Death* ! where is thy *sting* [in the *body*] ?  
O *Hades* ! where is thy *victory* [over the *soul*] ?
10. “The *sting* of *Death* is *Sin*———  
But thanks be to God, who giveth us the *victory*,  
Through our Lord JESUS CHRIST.” *1 Cor. xv. 51—57.*
11. “I am the *First* and the *Last* and the *Living*,  
And I became *dead* ; and lo ! I am *living*  
For ever and ever. Amen.  
And I hold the keys of *Hades* and of *Death*.” *Rev. i. 17.*
12. “I say unto you, *my friends* :  
Be not afraid of them who kill the *body*,  
But are not able to kill the *soul* ;  
But be afraid rather of Him, who is able  
To destroy both *soul* and *body* in *hell*.” *Matt. x. 28.*
13. “Who will transform the *body* of an *humiliation*,  
To become the resemblance of the *body* of his *glory* ;  
According to the energy of his ability,  
Even to *subject* all things unto himself.” *Phil. iii. 21.*

who, after zealously labouring through life to undermine the *hopes* of others, too fatally succeed at length in blasting their own!

In one of his last letters, published by the ingenious, the unprincipled, the execrable, and the wretched, *Condorcet*; who beset *D'Alembert* when expiring, and boasted, that, if he had not, "*D'Alembert would have flinched also*,"—like their grand master *Voltaire*—in all his dying horrors and agonies, "*worse than the furies of Orestes*"—the peevish and gloomy philosopher thus complains to his royal correspondent, *Frederick*:

—"Study *sometimes* engages me, and conversation *sometimes* entertains me; but I am soon fatigued with either; and am no sooner left to myself than my *uneasy reflections* recur, and my *solitude* again frightens and freezes me. In this condition, I resemble a man who sees before him a long and dreary desert, which he *must* pass; and at the end of that *melancholy prospect*, the *abyss of destruction* open to receive him: without finding, at the brink of that *bideous chasm*, a single person that will be *afflicted* with his downfall, or that will even *remember* his existence, when he has sunk into *endless perdition!!!*"

From such Philosophy, GOOD LORD! deliver us.

158. How utterly false, then, and unfounded are the visionary speculations of the votaries of "*a mistress that never grows grey!*" (if we listen to the illi-

14. "For *flesh and blood* [i. e. an *earthly* body] is not able  
To inherit God's kingdom; neither shall *corruption*  
Inherit *incorruption*." 1 Cor. xv. 50.

15. "The mass of *the sleepers*, [though] *dust of the earth*,  
Shall awake; some to everlasting *life*,  
But some to shame and everlasting *contempt*:  
When the *sages* shall shine, as the *brightrness*  
Of *the firmament*; and the *justified* of the many,  
As the *stars* for evermore." Dan. xii. 2.

16. "As *one* star differeth from *another* star  
In *glory*." 1 Cor. xv. 41.

17. "In my FATHER's house are *many mansions*." John xiv. 2.

Such are the awful, the animating, the ennobling doctrines of *Patriarchal* and *Evangelical* wisdom—revealed, "at sundry times and in divers manners," to his *rational* creatures, by the FATHER OF LIGHTS, through 'THE SON OF HIS LOVE'—THE ORACLE or Expounder of his Decrees, under the *Patriarchal* and *Christian Economy*. Nor can this important selection of strictly harmonizing *Texts* be deemed irrelevant or unseasonable by the *Mathematician* or the *Philosopher*, who would wish zealously to stem that Torrent of *Infidelity*, which is the disgrace of a boasted AGE OF REASON:

Dicite, O miseri! et causas cognoscite rerum;  
Quid sumus, et quidnam visuri gignimur; Ordo  
Quis datus; ————— quem Te Deus esse  
Jussit. —————

PERSIUS.

terate

terate Paine's eulogy on SCIENCE.)—And how wretched, how delusive the happiness she can afford, detached from RELIGION—that true mistress of the wise and good—whose humble handmaid SCIENCE ought to be.

—“*To be happy in old age,*” says Paine, “it is necessary that we accustom ourselves to objects that *can* accompany the mind *all the way through life*; and that we take the rest as good in their day. The mere man of *pleasure* is miserable in old age; and the mere drudge in *business* is but little better: whereas *Natural Philosophy, Mathematical and Mechanical Sciences*, are a continual source of *tranquil pleasure*. And, in spite of the gloomy dogmas of *Priests* and of *Superstition*, the study of these things is the study of the *True Theology*; it teaches man to *know* and *admire* the CREATOR: for the *principles of Science* are in the *Creation*, are *unchangeable* and of *divine origin*.”

159. Alas! what a wretched happiness did *Science* procure D'Alembert, who, at the close of his days, thus found to his cost, that he had been all his life long embracing a *cloud* for a *goddess*!—And that “the study of *these things* is not indeed the study of the *True Theology*,” we learn from the monstrous *errors* of ancient and modern *Sophists*; which led them to *forget* and to *vilify* the CREATOR: “The *principles of Science* are *not* indeed in the *Creation*,”—they lie much deeper than the *visible* world; and are only to be learned from REVEALED WISDOM and OMNISCIENCE:—whose *Sovereign Will* is the *Law* of the Universe; *changeable* at pleasure, though in HIMSELF “*unchangeable*.” James, i. 17.

160. These principles, the lowly and unassuming spirit of *Primeval* and *Patriarchal Science* endeavoured cautiously to trace and develope, amidst “the *obscurity* that prevails in the midst of things;”—humbly and devoutly thanking the FATHER OF LIGHTS for those faint *glimpses* of ETERNAL TRUTHS, which, from time to time, and from season to season, He vouchsafes to reveal to those truly Philosophic Students, who, in “an *honest and good heart*,” *hear*, seek, embrace, and keep the *Word of God*, whether communicated by *Revelation*, or thence unfolded by *Reason*: and earnestly and diligently, and devoutly, strive to *bring forth fruit with patience*.

“*Cælum* quippè ac *Terra*, ac *Mare*, omnisque *Creatura* quæ videri atque intelligi potest, ad hanc præcipuè disposita est *humani generis* utilitatem, ut *Natura Rationalis* de contemplatione tot specierum, de experimentis tot bonorum, de perceptione tot munerum, ad cultum et dilectionem sui imbuetetur AUCTORIS; implente omnia SPIRITU DEI, “in quo vivimus, movemur, et sumus.”—“Adhibita semper est universis hominibus *quædam* supernæ mensura doctrinæ, quæ [licet] *parcioris occultiorisque gratiæ*, sufficit tamèn (sicùt DOMINUS judicavit), quibusdam ad remedium, omnibus ad *testimonium*.—Ait Platinus: “Si MUNDI vocem audiremus, nihil aliud eum dicere quam DEUS ME FECIT; non *Cretensis Jupiter* aut *Arcas Mercurius*, sed DEUS ille ΑΓΝΩΣΤΟΣ [*nescibilis*], de quo Paulus ad *Athenienses*.”

De Vocatione Gentilium.

Scriptori

Scriptori huic egregio, verissimè de Dei cognitione, quatenus ex rationibus *physicis* eam colligere fas fit, suffragatur sana *Newtoni* sententia: *Princip.* p. 529.

“De Deo utique ex *phenomenis* differere ad PHILOSOPHIAM NATURALEM pertinet.”

161. Placet igitur, quoniam omnis disquisitio de *causis* et *effectis* naturalibus ad agnitionem CAUSÆ PRIMARIÆ perducere debet, “quæ minimè *materialis* est,” *Newtono* iudice — VINDICIAS quasdam THEOLOGICAS *Sapientum Priscorum*, atque *Newtoni* horum cultoris, subungere.

*De Philosophiâ Atomicâ Priscorum Chaldaeorum atque Hebræorum.*

162. Nec minùs injuriosè invehitur *Robison* in *Philosophiam Atomicam*, qualem excoluit *Newtonus*; quæ minimè confundenda est cum *Epicuræ* istâ nupèr redi-vivâ, Rationibus Metaphysicis atque Mechanicis rerum naturalium causas tribuente, et CAUSÆ PRIMARIÆ oblitâ. Hanc enim jure perstringit ipse *Newtonus* in *Optics*, p. 343, his verbis:

“And for rejecting such a *medium* (as is totally dense or full of matter), we have the authority of the oldest and most celebrated Philosophers of *Greece* and *Phœnicia*, who made a *vacuum* and *atoms* and the *gravity* of atoms the first principles of their philosophy: tacitly attributing gravity to *some other cause* than dense matter.”

“Later Philosophers banish the consideration of *such a cause* out of *Natural Philosophy*; feigning *hypotheses* for explaining all things *mechanically*, and referring other causes to Metaphysics: whereas the main business of Natural Philosophy is to argue from *phenomena*, without feigning hypotheses, and to deduce *causes* from effects, till we come to the VERY FIRST CAUSE, which certainly is not *material*.”

Hæc breviter effata et delibata tantum, fusiùs exponere, atque ex philosophiâ primâ confirmare, jam libet:

163. Priscorum Chaldaeorum atque Hebræorum, Philosophia physica erat *Atomica*, Cosmogoniæ *Mosaicæ* consentanea. Hanc invexerunt in Thraciam, *Orpheus*, ille “*Sacer interprèsque Deorum*,” qui undecim generationes antè Trojæ excidium floruit, teste *Suidâ*, seu annis  $366 + 1184 = 1550$  circiter antè Æram Christi Vulgarem; in Ioniam et Græciam, *Thales*, “*physicorum princeps*,” *Plerocydis* Syri discipulus; in Italiam, *Pythagoras*.—Lucida sidera omnes.

Quanto

Quanto fuerunt in honore Sapientes *Chaldaei* et *Hebraei*, apud *Græcos* vetustiores, discimus ex responso *Oraculi Pythici*, quibusdam sciscitantibus, *Ex gentibus quinam omnium sapientissimi?*

Μῆνοι Καλδαῖοι σοφίην λαχόν, ἡδ' αὖ Ἑβραῖοι,  
Αὐτογενήτων Ἀνακτῶ σέβασζομενοι ΘΕΟΝ ΑΥΤΟΝ.

“Soli *Chaldaei* sapientiam sortiti sunt atque *Hebraei*,  
*Per-se-genitum Regem* venerantes DEUM IPSUM.”

164. Præclarissimum extat testimonium in fragmentis *Versuum Orphicorum*, ab *Onomacrito* congectis, de Decalogo Sacro, apud Montem *Sinai* promulgato, annis 1649 circitèr ante *Ær. Christ.* (secundùm emendationem nostram *Sacræ Chronologiæ*, posthàc forsàn edendam).

Ἀρχὴν ΑΥΤΟΣ ἔχων, ἅμα καὶ Μέσον, ἡδὲ Τέλευτῃν  
Ὡς λογῶν Ἀρχαίων ὡς Ὑδρογενῆς διέλαξεν,  
Ἐκ ΘΕΟΘΕΝ γινώμασι λαβὼν κατὰ διπλᾶ καὶ Θέσμον.

“*Principium* Ipse habens, simul et *Medium*, atque *Finem*:  
Ut sermo Priscorum; ut *Aqua-genitus* præcepit,  
E Deo sententiis quum accepisset *duplicem Legem*.”

Præclara hæc descriptio DEI IPSIUS optimè consentit cum *Scripturis Sacris*.  
*Isa.* xli. 4. *Rev.* i. 8. &c. &c.

“HIM First, HIM Last, HIM Midst, and without End.” *Milton.*

Vox Ὑδρῶ, antiquitùs pro Ὑδωρ, “*aqua*.”—*Hesychius*. Per Ὑδρογενῆς igitur elegantèr expressit *Orpheus* vocem Hebræam *Moseb* (vel *Moses*), quæ significat “ex aquâ ereptum.”—*Exod.* ii. 10. Et per διπλᾶ καὶ Θέσμον, “*duplicem Decalogi Tabellam*”—“*digito DEI descriptam*.” *Exod.* xxxii. 26. et xxxiv. 1. (g). Atque hoc *Orphici* testimonium expressisse videtur *Juvenalis*, *Sat.* xiv. 102.

“Tradidit arcano quodcunque volumine *Moses*.”

165. Alterum

(g) Hujusce eximii *Fragmenti Orphici*, ab *Onomacrito* conservati, auctoritatem insectatur doctissimus *Cudworth*, ὁ πλατωνίζων, sed hypercriticè potius, ut videtur, *Intellectual System*, p. 300.

“There seem to be some *Orphic Verses* supposititious, as well as there were *Sibylline*, &c.—Cæterum cum hisce probè consentiunt versus *Orphici* quos ipse *Cudworth* pro genuinis agnoscit, et ex *Procla* citat, p. 301.

ΖΕΥΣ πρῶτος γενέο, ΖΕΥΣ ὕστατος ἀργικεραυνός,  
ΖΕΥΣ κεφαλῇ, ΖΕΥΣ μέσσα, ΔΙΟΣ δ' ἐκ παντὶ τετυκται.

“*Jovis primus* existebat, *Jovis ultimus* altitonans,  
*Jovis caput*, *Jovis medius*, à *Jove omnia fabricantur*.”

Et

165. Alterum, quoque, nec minùs insigne testimonium de *Chaldaeorum* divinatione profert *Orpheus*.

Οὐ γὰρ κεν τις ἴδοι Σιήτων μεροπίων ΚΡΑΙΝΟΝΤΑ,  
Εἰ μὴ μενοεινῆς τις, ἀπορρώξῃ Φυλὰ αἰθέρι  
Χαλδαιῶν· Ἰδρὶς γὰρ ἐστὶν Ἀστροίο παρειαῖς.

“Nullatenùs enim quisquam mortalium articulatè loquentium viderit *REGEM*,  
Nisi *dilectus* quidam antiquo ab origine gentis  
*Chaldaeorum*; peritus enim erat *astri exortus*.”

Referunt hoc vulgò interpretes ad *Abrahamum*, “quem omnis vetustas Orientis summum astrologum fuisse crediderit.” *Scaliger de Emend. Temp. Not.* in *Fragment.* p. 48; et *Cudworth*, p. 300. Sed manifestò respicit vatem Chaldaeum, *Balaam*, *Mosis* co-ævum, “qui apud *Peth-Ur* (seu Hebræicè *Beth-Ur*, “Domus Lucis,”) juxtà fluvium (*Tigrim*) degebat,” (*Numb.* xxii. 5.); et qui insigne illud vaticinium cecinit de *Sbilo*, *Jacobi* progenie, (*Gen.* xlix. 10.) seu de *Messia* “Rege,” *Num.* xxiv. 17.

“*Video ILLUM, sed non nunc*;  
*Cerno ILLUM, sed non profè*;  
*Prodibit ASTRUM ex Jacobo*,  
*Exoriatur SCEPTRUM ex Israëlè*.”

Cujusque posterì, Μαγοὶ ἀπὸ ἀνατολῶν, “*Magi Orientales*,”—ἀέτι “*viderunt astrum ejus in exortu suo*,” (ἐν τῇ ἀνατολῇ,) 1600 annis postea, è longinquo contipicati, ποιεῖ forsàn *natali* Christi. Confer *Matt.* ii. 1—10, et *Luc.* ii. 9—15.

166. Priscos *Chaldaeos* atque *Hebræos* vacuum et atomas admisisse in cosmogoniam suam, colligere licet ex *Virgilio*, mythologiæ antiquæ observantissimo,

Et versum secundum, levi variatione, ex ipso *Plutarcho* quoque citat, p. 305.

ΖΕΥΣ ἀρχὴ, ΖΕΥΣ μεσσα, ΔΙΟΣ δ' ἐκ παντὸς πέλονται.

“*Jovis principium, Jovis medius, à Jove omnia sunt*.”

Ubi pro κεφαλή citantis *Procli*, *Plutarchus* vocem synonymam ἀρχὴ citat; utramque proculdubio à voce *Hebræd*, ראש, vel ראשית ambiguè “*caput*” vel “*principium*” designante. *Gen.* i. 1.—Vide quoque *Not.* (\*).

Necnon ex *Timotheo* chronographo quasi *Orphicæ Theologiæ* foret; p. 305.

Διὰ τῆς ΘΕΟΤΗΤΟΣ παντὰ ἐγένετο,  
Καὶ ΑΤΤΟΣ ἐστὶ παντὰ.

“*Per DEITATEM omnia facta sunt*,  
*Et IPSE est Omnia*.”

Veruntamèn fatendum est quòd *Orpheus* ipse falsa veris immiscuit. Refert enim *Justinus Martyr*; Πολυθεοτήτος πατήρ καὶ πρῶτος διδάσκαλος—quòd “*Polytheismi pater atque præceptor primus fuit*” *Orpheus*. Vide *Cudworth*, *Int. Syst.* p. 298.

ubi *vinosum Silenum*—"Custodem famulūque Dei (*Bacchi*) alumni," et proinde ex Patriarchis forsā vetustissimum, (instar *Noab*, vino oppressi, *Gen.* ix. 21—24.) itā vaticinantem inducit, *Eclog.* vi. 31.

"Nāmq̃ue canebat, utl̃ MAGNUM per INANE coacta  
Semina terrarūque, animāque, marisque fuissent,  
Et liquidi simul ignis : ut his exordia primis  
Omnia ; et ipse tener Mundi concreverit orbis."

167. Paritéque *Euripides*, *Anaxagoræ* discipulus, traditionē vetustissimam refert, in fragmento *Menalippes*, *Barnes Eurip.* p. 481, citato à *Diodoro Siculo*, I.

Οὐκ ἐμὸς ὁ μυθός, ἀλλ' ἐμῆς μητρός παρὰ  
Ὡς οὐρανὸν τε γαίαν τ' ἡν μορφῇ μιᾷ  
Ἐπεὶ δ' ἐχωρίσθησαν ἀλλήλων δίχῃ,  
Τίτ' ἔσσι πάντα, κ' ἀνέδωκαν εἰς Φαῶς,  
Δένδρα, πτηνὰ, θηρὰς, ἔς θ' ἄλμῃ θρεφεί,  
Γενέσθαι τε θνητῶν.

"Nec meus hic sermo, sed quem præcepit Mater :—  
*Ut cælum et terra erant forma una ;*  
Ubi verò à se invicē sejuncta sunt,  
Pariunt omnia, edideruntque in lucem,  
*Arbores, aves, feras, [piscésque]* quos alit mare,  
*Gemísque mortalium.*"

Manifestò desumuntur hæc *mythica* ex *Cosmogoniā Mosaicā*; de statu terræ *chaotico*, et generatione *vegetabilium, animalium* atque *hominum*, ordine *Mosaico* differentiā; cæterū in hoc peccant quod SUMMI OPIFICIS vim creatricem vix, et ne vix quidem, respiciunt, sed productionem rerum *spontaneam* innuunt.

168. Atqui hīsce excerptis, seminarium habes *Philosophiæ Atomicae* qualem excolebant Sapientes Scholæ *Chaldaæ primæ* ac *Hebrææ*, antequā eam pessunderunt atque inquinaverunt pravè philosophantes, *Magi, Brachmanni, &c.* Orientales; atque *Stoici, Epicuræi, &c.* Occidentales, ingenti veræ Theologiæ atque Philosophiæ detrimento.

169. Et egregiè distinguit *Plutarchus*, inter "valdè antiquos theologos atque poetas"—quales fuerunt *Orpheus* ejusque discipuli, qui "Jovem principium, Jovem medium, à Jove omnia fiunt"—præceperunt, et "hīsce juniores, qui Physici sunt appellati"—quales post *Thaletem* exstiterunt *Anaximander, Anaximenes, &c.* Scholæ *Ionicae*; atque *Itali* isti degeneres Scholæ *Pythagoræ, Leucippus, Democritus* et *Epicurus*, qui, "ab hoc principio honesto atque divino temerè palantes, causam  
N  
omnium

omnium primariam in corporibus, corporeisque affectionibus, pulsibus, mutationibus commixtionibusque posuerunt."—Unde Φυσικοί et Ἀθεοί ("Naturalists" and "Atheists") indifferentè, et quasi per nomina ejusdem ferè significationis, vulgò sunt appellati. *Cudw.* p. 305.

170. Etiàm *Anaxagoras* ipse, appellatus Νῆς, "Mens," κατ' ἐξοχὴν, qui priscam notionem MENTIS SUPREMÆ revocavit, "Ejus opificis in mundo condendo, rationibusque physicis, nullatenùs est usus, sed ad causas rerum merè mechanicas, aëres, ætheres, et aquas minimè idoneas, aliæque prorsùs absurda, confugit," ità querente *Socrate*, in *Phædone*.

171. Hinc ansam vituperandi arripiens *Aristoteles*, totam *Physicam Atomicam* infectabatur præceps, ex rationibus suis *Metaphysicis*, multa somnians de quinto genere elementorum è quo fiant mentes et astra, de fugâ vacui, de pleno universali, de æternitate mundi, de formis substantialibus (seu εντελεχειαις). Inaniter autèm atque arrogantè gloriatur—"Se videre, quod paucis annis magna accessio facta esset; brevi tempore, Philosophiam planè absolutam fore."—*Cicero*, *Tuscul.* I. 10; III. 28. *Acad.* I. 4.

172. *Aristotelis* fastum jaçtantiàmque secuti, *Cartesiani* et *Leibnitziani*, ingenti scientiarum detrimento, Physicorum Græcorum *Mechanicam* irrationalem et phantasticam recalebant; vortices, monadas, &c. temerè fingentes: donec modestum *Newtoni* ingenium priscas revocabat artes; atque à Logomachiis averfus, ad Disciplinam Scholæ *Ionice*, *Antiquæ Hebrææ* atque *Chaldææ*, serò tandem redibat, *Physicam Atomicam* instaurabat, eam fundamentis solidis atque inconcussis *Inductionis* atque *Experimentorum* stabiliendo.

—"Hypothesen non fingo: Quicquid enī ex phænomenis non deducitur, Hypothesis vocanda est. Et Hypothesen, seu *Metaphysicæ*, seu *Physicæ*, seu *Qualitatum occultarum*, seu *Mechanicæ*, in PHILOSOPHIA EXPERIMENTALI locum non habent." *Principia*, pag. ult.

173. Quàm injuriosè igitur invehitur Professor *Robison* in *Philosophiam Atomicam*, qualem excolebant prisci *Chaldæi* et *Hebræi*, eorūque Discipuli; et qualem instaurabat *Newtonus*, sobriam, sanam, principiis *Mathematicis* reconditionibus et subtilioribus forsàn quam pro captu tyronum, imò *Mathematicè* doctorum, (etiàm *Professorum* forsàn), stabilitam atque demonstratam. *Logicam* certè parùm sapit, ex abusu alicujus rei, artis vel scientiæ, usum detrectare; et *Mechanismum* adèd irrationalem, absurdum et impium Recentiorum Philosophitarum, ex *Mechanicâ Rationali Newtonianâ* deducere.

## De Æthere Antiquo, Deo Fiſto Gentilium.

174. Vocem ipſam *Æther* mutuatus eſt *Newtonus* ex Philoſophiâ Priſcâ, itâ referente *Cicerone*. N. D. II. 33.

“Et cùm quatuor ſint genera corporum, *viciffitudine* eorum mundi continuata natura eſt. Nam ex *terrâ*, aqua; ex *aquâ* oritur aër; ex *aëre*, *æther*: Dein retrorſum *viciffim*, ex *æthere*, aër; ex *aëre*, aqua; ex *aquâ*, *terra infima*, &c.”

Exemplum hîc habes *Compositionis* et *Resolutionis* antiquiſſimæ, ſecundùm quas “*mundi partium conjunctio continetur*”—ex mente Phyſicorum priſcorum, ſanum, Cantui *Sileni* atque *Cosmogoniæ Moſaicæ* accommodatiſſimum: ubi *æther* mani- feſtò reſpondet “*liquido igni*,” quarto nimirum elemento, (hodiè, *fluido electrico*) ſubtiliſſimo, omnium corporum poros et interſtitia liberrimè permeanti, quod inter potentiſſimos naturæ agentes jure recenſetur; et cujus identitatem cum *igne cæleſti* (*lightning*) detexit et confirmavit, noſtro tandem ævo, curioſa ſedu- litas ſagaciſſimi Naturæ indagatoris, *Benjamini Franklin*.

Vox *αιθρη* quoque, ſi *compositionem* ejus reſpicias, derivatur ex *αιθω*, “*uro*,” et *αηρ*, “*aër*,” ſeu *atmoſphæra* (quæ forſan ex *אור aur*, “*lux*,” ultimò dedu- cenda eſt). Et quidèſſim ab *Hefycbio* definitur *Αιθρη*, ὁ ὑπὲρ τὰ νεφελὰ τόπος, “*regio ſuprà nubes*;”—atque ſignificatione alterâ ſynonymâ, *εμπυρις*, “*in- flammationem*.”

175. Pro ſymbolo (*b*) certè “*DEI lucem inaccessibilem habitantis*,” primitus, Patriarcharum ſæculis, *Job*, *Abraham* atque “*Chaldaeorum progenitorum, Aur*, (i. e.

(*b*) Exordium Elegiæ à reverendo viro et poetâ docto et diſerto, *Thomâ Maurice* ſcriptæ in obitum celeberrimi et optimi viri, *Gulielmi Jones*, Indorum Apoſtoli, Chriſtianique Philoſophi, pulchrè et ornatè deſcribit patrias ſedes *Chaldaeorum*, et primævam diſciplinam *Magorum*.

“Where the dark cliffs of rugged *Taurus* riſe,  
From age to age by blaſting lightnings torn,  
In glory burſting from the illumin’d ſkies,  
Fair *Science* pour’d her firſt auspicious morn.

The hoary *Partian* Seers, who watch’d by night  
Th’ eternal Fire in *Mithra*’s myſtic cave,  
(*Emblem* ſublime of that PRIMÆVAL LIGHT  
Which to yon ſtarry orbe their luſtre gave,)

Exulting, ſaw it’s gradual ſplendours break,  
And ſwept, ſymphonious, all their warbling lyres,  
Mid *Scythia*’s frozen glooms THE MUSES wake,  
While happier *India* glows with all their fires.”

(i. e. "*Lux*," ) incolentium," *Gen.* xi. 28. usurpatus est Αἰθερ, seu "*Aër ille igneus*."

176. *Theologia Chaldaea* præclarissimum extat specimen, apud *Suidam*, de *Orpbeo* ità differentem :

ΕΦΗΣΕ ΔΕ, ὅτι ΦΩΣ, ῥήξαν τον Αἰθερα, ἐφωτίσε την Γην, καὶ πᾶσαν Κτισιν· ΕΚΕΙΝΟ ΕΠΕΩΝ "ΤΟ ΦΩΣ" ΤΟ ὙΠΕΡΤΑΤΟΝ πάντων, τὸ "ΑΠΡΟΣΙΤΟΝ," τὸ πάντα ΠΕΡΙΕΧΟΝ· ὍΠΕΡ ὠνομάσε ΒΟΥΛΗΝ, ΦΩΣ, ΖΩΗΝ.

Τὰ τρία ταῦτα ὀνομάζα ΜΙΑΝ ΔΥΝΑΜΙΝ ἀπεφηνάτο καὶ ἘΝ ΚΡΑΤΟΣ τῆς ΔΗΜΙΟΥΡΓΟΥ πάντων ΘΕΟΥ, τῆς πάντας ἐκ τῆς μη. οὐχὸς παραγαγοντος εἰς τὸ εἶναι, ὅρα τὰ τε καὶ ἀοράτα.

"Fatus est *Orpheus*, LUCEM, rupto *Aethere*, Tellurem illustrasse, omnemque Creationem : Illam dicens LUCEM, *supremam* omnium, "*inaccessibilem*," omnia continentem ; quam nominavit CONSILIUM, LUCEM, VITAM."

"Hæc tria nomina declarant UNAM POTENTIAM, UNUMQUE DOMINIUM OPIFICIS omnium DEI, qui adduxit omnia *ex non existente in existentiam*, *visibilia pariter et invisibilia*."

177. Mirus fanè et ferè incredibilis consensus hic observandus cum Libris Evangelicis — Nam "*Deus est LUX*," 1 *John*, i. 5. "*Lucem habitans inaccessibilem*," 1 *Tim.* vi. 16. Et *JESUS CHRISTUS* est "*Lux Mundi*," *John* viii. 12. Ut et "*SAPIENTIA DEI*," *Luk.* vii. 35. et *Matt.* xi. 19.—itèmq̃ue "*VITA*," *John* i. 4. et xiv. 16. Et declaravit *CHRISTUS*, Εγὼ καὶ Πᾶς ἘΝ ἑσμεν.—*Orpbeo* nimirum optimè interpretante—ἘΝ ΚΡΑΤΟΣ—"PATER et EGO *unum sumus* [DOMINIUM]." *John* x. 30.

Et *Milton*, adhuc sublimius et eruditius, varias sententias veterum Philosophorum exponit, in celeberrimâ illâ *Lucis* invocatione, P. L. III. sub initio :

"Hail, HOLY LIGHT ! Offspring of Heaven, First-born,  
Or of th' eternal co-eternal Beam ;  
May I express thee unblam'd ! Since " GOD IS LIGHT,"  
And never but in " *unapproach'd light*  
*Dwells*" from Eternity, dwelt then in Thee,  
Bright *Effluence* of bright *ESSENCE* INCREATE :  
Or hear'st thou, rather, pure *Ethereal Stream*,  
Whose fountain who shall tell ? Before *the Sun*,  
Before *the Heavens* thou wert, and at the voice  
Of God, as with a mantle, didst invest  
The rising *World of Waters*, dark and deep,  
Won from the void and formless *Infinite*."

Notandum quòd per *Mithram* intelligebant *Paribi Magi* antiquissimi non *Solem* (ut malè posteri), sed *Sole* superiorem ; quem appellarunt, Ὁ κρυφίος Θεός, "*Deus absconditus*,"—Παντων Ποιητής καὶ Πάτερ, "*Omnium Opifex et Pater*." *Cudworth*, p. 286. Quibuscum optimè consentit *Job* xxiii. 9. *Judg.* xiii. 18. *Isa.* ix. 5. *Isa.* xlv. 15. Vide § 179.

178. Sana

178. Sana et sublimis *Noachidarum* Theologia pessundari et corrumpi incœpit circâ quintam à Diluvio generationem; et potissimum à *Nimrod*, *Cushtitarum* principe, qui cultum astrorum primus introduxit; etiâ proverbio celebratus, ut “*Ingens ille venator, coram Domino*,” qui post mortem ejus, à subditis superstitionis, translatus est in astrum *Orionis* cum canibus (qui *Sirius* et *Canicula* sunt appellati), quasi in cœlis etiâmodum venaturus *Ursam Majorem* ejusque Catulos, Circulo *Arctico* commorantem, et motu diurno revolventem; quam vivus insectabatur in Montibus *Affyriæ*, *Ararat* (i): Nam hic bellator acerrimus quoque, cum ab Oriente migraturus sit in sedem ab oraculo suis destinatam, subleivit rebellis “in amœnâ terrâ *Shinaar*, ubi principium dominationis suæ posuit *Babel*, seu *Babylonem*; et inde egressus, invasit *Affyriam* (sedem *Noachidarum* post Diluvium, et *Sbemitæ Peleg*, in distributione divinâ terrarum, allocatam), et *Niniven* condidit.” Confer *Gen.* x. 8—12. et xi. 1—8. et *Josephum*.—Colebatur hic *Rebellis* sub nomine *Bel* (à *Heb.* בל *Baal*, “Magister,”) ab *Affyriis*, undè Græcorum *Belus*; cujus nomen proprium forsân erat *Nin*—(i. e. πῦ “*Filius*,”) (k)—utpotè clarissimus filiorum *Cbus*; et quidem appellatur ipsa *Ninive* ab *Herodoto*, παλαιὰ, ἡ Νινῶ, “*Civitas Nini*.”—Fuit autem *Pronepos Cbus*, per intermedios *Raamah* et

(i) Hujusmodi venationem pulchrè describit *Homerus*, *Il.* xviii. 485.

Ἀρκτον δ' ἦν καὶ Ἀμαζαν ἐπικλησὶν καλεουσιν  
Ἡ τ' αὐτο σρεφέται καὶ τ' Ὀριωνα δοκευσι.

“*Ursūque*, quam cognomine *Plaustri* appellant [*Ægyptii*],  
Quæ ibidē se vertit, observâtque *Oriensem*”

—quasi illum et canes venaticos metuens.

Atque iterum *Orionem*, in *Infernis*, similiter occupatum introducit, *Odyss.* xi. 571.

Τὸν δὲ μετ' Ὀριωνα πέλωριον εἰσενοήσα  
Θηρας ὅμῃ ἐλευνία κατ' ἀσφοδελὸν λειμῶνα,  
Τῆς αὐτὸς κατέσφηνεν ἐν οἰκολοισιν ὀρεσσίν,  
Χερσὶν ἐχὼν ῥοπαλὸν παγχάλκεον αἰὲν ἀγγες.

“Postea, *Orionem ingentem* aspexi,  
Feras uâ cogentem per *asphodelum* pratum,  
Quas *Ipse* occiderat in montibus desertis;  
Manibus tenentem *clavam* proreâ *æneam*, semper *infractam*.”

Annon facillè derivari potest *Ὀριων* à *Chaldæo Uriah* (“*Lux Domini*”), quæ in *Versione Græcâ Septuagint.* in casu obliquo, redditur *Ουριαν*, 2 *Sam.* xi. 6.?

(k) *Ingentis* hujusce tyranni nomen proprium fuisse πῦ *Nin*, “*filius*,” cui per odium et ludibrium cognomen indiderunt *Sbemitæ* subjugati, תיבני *Nimrod*, “*Archirebellem*,” confirmatur ex *Trogo Pompeio*, seu *Justin* Lib. I. initio.

“Primus omnium *Ninus*, Rex *Affyriorum*, veterem et quasi *avitum* gentibus morem, [i. e. *Regimen Patriarchum*,] novâ imperii cupiditate mutavit. Hic primus intulit bella *finitimis*, et rudes adhuc ad resistendum populos, terminos usque *Libyæ*, perdomuit.”—“*Domitis* igitur proximis, cum accessione virium fortior ad alias transiret; et proxima quæque victoria instrumentum sequentis esset, totius *Orientis* populos subegit. Postremum illi bellum cum *Zoroastre Rege Babilianorum* fuit (qui primus dicitur

et *Sheba*, adeoque *Pelegi* co-ævus, quintus nimirum à *Noah*, non tertius, ut hæstendū à Chronologis malè supponitur.

179. Ingruenti huic idololatriæ fortiter se opposuit *Job*, septimus vel octavus à *Noah*. (Vide *Abulfaragi*, p. 13.)

“ Si aspicerem *lucem* \* [*Solis*] ubi splendebat,  
 Aut *Lunam* gloriâ incedentem;  
 Si cor meum in occulto seductum esset,  
 Aut manus mea ab ore oscularetur;  
 Etiam hoc foret *crimen judiciale*,  
 Ita enim mentitus essem DEO SUPREMO.” *Job xxxi. 26.*

180. Sed, *damnoſa quid non imminuit dies?*—Sublimem et sinceram Patriarcharum *Chaldaeorum* atque *Hebræorum* Theologiam—“SPIRITUM SUPREMUM in *spiritu* atque *veritate* ritè venerantium,” tandem corrumpit et inundavit *Sabianismus*, seu pravissima idololatria astrorum; “*fingebant enim idololatræ*,” ut benè notat *Newtonus*, *Princip.* p. 529.—“*Solem, Lunam et Astra, Animas Hominum*, et alias *Mundi partes*, esse *partes DEI SUMMI*; et idèò *colendas*, sed falsò.—Atque ex cunctis Philosophis Mythologisque *Gentilibus*, cheu!

“ *Apparent rari nantes in gurgite vasto*,”

qui de DEO ritè sentiebant.

181. Operam Philosophis nostris *Britannis* hæud ingratham me impensurum spero, si cursim ex *Græcis Romanisque* Mythologis, miram et plorandam sanè cœcutiam atque vecordiam paucis exemplis illustrem, de *Deo materiali* per vocem *Aether*, vel *Æther*, ab utrisque intellecto, turpissimâ Priscæ Theologiæ depravatione.

Tragœdorum Græcorum antiquissimus, *Æschylus*, *Ætherem*, esse *Deum* apertè posuit.

dicitur *Artes Magicas* [seu disciplinas *Magorum*] invenisse, et *mundi principia, siderumque motus spectasse*.) Hoc occiso, et ipse decessit; relicto impubere adhuc filio *Ninya* et uxore *Semiramide*—

Hic, *Justinus*, more *Græciæ* mendacis, vera falsa immiscuit. *Nimrodum* probè refert, finitimos invadentem, atque interficientem ultimò, paulò antè obitum, *Zoroastrem*, (forsàn *Peleg* ipsum, in Montibus *Ararat*,) Archimagum, peritissimūque Astronomum. Sed errore planè ridiculo, ob infcitiam Linguarum Orientalium, *Trogus* transtulit urbem *Niveu* à *Nimrod* conditam, seu *Niniven*, in filium “*Ninyam I*”—Et de *Semiramide* fabulatur! Vera enim *Semiramis*, quinque tantum generationibus, teste *Herodoto*, antecessit *Nitocrem*, insignem Reginam, quæ *Babyloni* exstruendo atque ornando ultimam manum imposuit; illa autem videtur fuisse magni *Nebuchadnezzari* uxor, de quo *Daniel*, v. 10.

Secundum emendationem nostram *Chronologiæ Sacræ*, incidit distributio terrarum habitabilium inter Colonias Noachidarum, “in diebus *Peleg*,” (i. e. “*Divisionis*,”) ubi floruit ille *Ninus* Archirebellis, anno 541 circiter, post diluvium; seu anno 2615 antè Æram Christianam: floruit autem illa *Semiramis* quæ mœnia *Babylonis* construxit, 166 annis saltè antè obitum *Nebuchadnezzar*, sive 166 + 561 = 727 antè Æram Christianam. *Semiramis* proinde pro uxore *Nabonassari*, (cujus æra incepit 747 annis antè Christ.) jure haberi potest.

ZETΣ

ΖΕΥΣ ἐστὶν Αἰθήρ, Ζεὺς δὲ Γῆ, Ζεὺς δ' Οὐρανός, Ζεὺς τοὶ Πάντα.

“ Jovis est ÆTHER ; Jovis item Terra, et Jovis Calum, Jovis denique Omnia.”

182. Audi quoque Hippocratis commentum, De Princip. § 1.

Δοκεῖ δὲ μοι ὁ καλεόμενός Θέρμων, ἀθανάτων τε εἶναι καὶ νοεῖν πάντα, καὶ ὄρναι καὶ ἀκρῆναι καὶ εἰδέναι πάντα, καὶ τὰ οὐρα καὶ τὰ ἐσομένα· τῆς δ' ἐν τῷ πλείστον, ὅτε ἐξαρχῇ πάντα. ἐξεχώρησεν ἐς τῶν ἀνωτάτω περιφορῇ καὶ ὀνομασθῆναι μοι αὐτὸ δοκεῖσιν οἱ παλαιοὶ Αἰθέρα.

Ἡ δευτέρα μοῖρα, ἡ κατωθὲν αὐτῇ, καλεῖται μὲν Γῆ, ψυχρὴν καὶ ξηρὴν καὶ πολλὴν πυρὸς καὶ ἐν τῇ ἐν ἡμῶν πολλὴν τῆς θερμότητος. Ἡ δὲ τρίτη μοῖρα, ἡ καὶ τῆς Ἡρώος χωρίον εἰληφῇ, Θέρμων τις καὶ ὑγρὸν εἶναι. Ἡ δὲ τέταρτη, ἡ τῆς ἐγγύτατης πρὸς τὴν Γῆν, ὑγρότατον τε καὶ παχύτατον.

“ Mihi quidē videtur Id quod CALIDUM vocamus (Gallicè CALORIQUE) esse *immortale* ; atque omnia *percipere et videre et audire*, omniāque *scire tam presentia quam futura*. Hoc igitur, maximā ex parte, omnibus perturbatis [*chaotice*], excessit in orbem altissimum ; idque nominasse mihi videntur Prisci ÆTHEREM.”

“ Secunda pars, eaque inferior, vocatur TERRA. Estque *frigidum et siccum et permobile* ; in hac quoque inest *calidi* multum. Tertia autē pars, quæ *aëris* regionem fortiebatur, est quoddam *calidum* simul et *humidum*. Pars verò quarta, terræ proxima, est *humidissimum* simul et *densissimum*.”

183. Et convenienter Virgilius, Æn. VI. 724.

“ Principio Calum et Terras, Campōsque liquentes,  
Lucentēque globum Lunæ Titaniāque Astra,  
SPIRITUS intūs alit ; totāque, infusa per artus,  
MENS agitat molem, et magno se corpore miscet.”

Altiūs hīc sonant “ *Spiritus et Mens* ;”—sed sensu prorsus *materiali*, intelligenda ; ut ex sequentibus patebit, Georg. II. 340.

“ Cum primum lucem pecudes hausere, virūque  
Ferreā progenies duris caput extulit arvis,  
Immissaēque Feræ sylvis, et Sidera cœlo.”

184. Rationem reddente Ovidio, Metam. I. 75.

“ Neu regio foret ulla suis animantibus orba,  
Astra tenent Cœlestē Solū, Formasque Deorum,  
Terra Feras cepit.”

185. Pleniūs

185. Pleniùs autèm et luculentiùs, *Virgilio*, *Georg.* IV. 219.

“ His quidam signis, atque hæc exempla secuti,  
 Esse *apibus* partem DIVINÆ MENTIS, et HAUSTUS  
 ÆTHEREOS, dixère; DEUM námque ire per omnes  
*Terrásque*, tractúsque *Maris*, *Cælúmque* profundum.  
 Hìnc, *Pecudes*, *Armenta*, *Virces*, genus omne *Ferarum*,  
 Quemque sibi *tenues nascentem* arcessere vitas:  
 Scilicet hùc reddi deinde, ac resoluta referri  
 Omnia; nec *Morti esse locum*; sed *Vivæ* volare  
*Sideris* in numerum, atque alto succedere *Cælo*.”

186. Et apertissimè quidem, *Georg.* II. 323.

“ Tùm PATER OMNIPOTENS, fœcundis imbris ÆTHER,  
*Conjugis* in gremium lætæ descendit, et omnes  
 Magnus alit, magno commixtus corpore, *fatus*.”

Hìc procùl dubio, “ *Pater Omnipotens*” et *Æther*, pro synonymis habentur à *Virgilio*; sicùt à cæteris passim Poëtis *Latinis*,—JUPITER et ÆTHER.

187. Paritèr *Horatius*, *Od.* I. xxii. 19. et L. i. 25.

“ Quod latus mundi, *Nebulæ*, MALUSQUE  
 JUPITER urget.”

“ ———Manet sub JOVE FRIGIDO  
 Venator.”———

188. Paritérque *Lucanus*:

“ JUPITER est quodcunque *vides*, quocunque *moveris*.”

189. Atque identitatem *Mentis Divine* et *Humane* apertissimè tradiderunt Philoſophi, referente *Cicerone*:—“ Sive *anima* sive *ignis* sit animus (*humanus*) eum jurarem esse *divinum*.”—“ Et quidem si *Deus* aut *anima* aut *ignis* est, idem est animus hominis:”—“ Ergò *animus*, ut ego dico, *divinus* est; ut *Euripides* audet dicere, *Deus*.”

Et ex hominum motu libero argumentum fabricârunt pro animi æternitate: ut docet quoque *Cicero*:—“ Quòd *se ipsum moveat*, quis est qui hanc naturam *animis* esse tributam neget? *Inanimum* enim est omne quod *pulsu* agitur *externo*; quod autèm est *animal*, id *motu* cietur *interiore* et *suo*.—Sentit igitùr animus *se moveri*; quod cum sentit, illud sentit, *se vi suâ*, non *alienâ*, *moveri*; nec *accidere posse* ut ipse unquam à se deferatur; ex quo efficitur *æternitas*.” (Vid. § 193.) —“ Ex DIVINITATE *animos* haustos habemus.”

190. Talia

190. Talia sunt dogmata "*Insanientis Sapientie*"—CREATOREM cum *creatis*, homines cum *bestiis*, *animantia* cum *inanimatis*, confundentis; SPIRITUI SUPREMO, existentiam *materialem* impiè tribuentis, *immortalitatem* innatam *animorum hominum pecudumque* falsò prædicantis; DEUM OPTIMUM MAXIMUM, (cujus est "*dare et adimere*," vitam commodare et vitam perdere, creare atque annihilare, solo sui ipsius numine, et liberrimo arbitrio, nullo cogente *Fato* seu *Necessitate cæcâ*), ingratiè prætermittentis et turpiter dehonestantis!

191. Optimè igitur et acutissimè *Paulus* de Philosophis Gentilibus:—*Rom. i. 22. (1).*

Φασκοῖτες εἶναι σοφοί, ἐμὼπανῶησαν.

"Autumantes se esse SAPIENTES, facti sunt STULTI."

(1) Quantum autem insipuerunt, et quàm miserè cæcutierunt, vel ævo *Augusti* literarum culturâ celebrato, Philosophi *Romani*, uno alterove exemplo ostendere libet:

Gravem illam, sublimem et magnificam, DEI SUMMI descriptionem *Horatianam* quis non miratur humaniorum literarum scientiâ vel levitèr imbutus? *Od. III. 4, 42.*

—"Scimus ut impios  
*Titanas*, immanemque turmam  
 Fulmine sustulerit caducos,  
 Qui *terram incertem*, qui *mare* temperat  
 Ventosum; et *urbes*, *regnâque tristia*,  
*Diosque*, *mortalisque turbas*,  
 Imperio regit UNUS æquo."

Petuntur hæc sanè ex *Philosophiâ primâ*, et manifestò respiciunt *Sodoni* atque *Gomoræ* excidium, *Gen. xix. 24.*; aut *Gigantes* formæ, *Gen. vi. 4.* Diluvio peremptos. Sed quàm indigna proximè sequuntur?

"Magnum illa terrorem intulerat Jovi,  
 Fidens *Juventus* horrida brachiis,  
*Fratreisque* tendentes ophæo  
 Pelion imposuisse Olympo!"

Quàm incongrua, quàm absurda, quàm impia cadit conclusio?—Quinque mortales juvenes nempe "*terrorem intulisse* DEO SUMMO," ne cælum scandant ipsamque à solio detrudant!!!—Nónne in hoc casu Poetarum *Ethicorum* princeps (ut fertur *Horatius*), factus est stultissimus?

Et quis feret vel ipsum *Ciceronem* pravissimè philosophantem de *perjurio*, quasi à NUMINE SUMMO prorsus neglecto atque impunito? *De Officiis*, III. § 28.

"Quid est igitur, dixerit quis, in *jurjurando*? Num *iratus* *timemus* JOVEM? At hoc quidem COMMUNE EST OMNIUM PHILOSOPHORUM (non eorum modò, qui *Deum* nihil habere ipsam negotii, et nihil exhibere alteri [ut *Epicureorum*]; sed eorum etiàm qui, *Deum* semper agere aliquid et moliri volunt [ut *Stoicorum*, *Peripateticorum*, &c.] ) NUNQUAM NEC IRASCI DEUM NEC NOCERE."

Nónne *Sophistæ* tales, (sicut *Cicero* *Epicureos* incusat),

"DEUM nomine ponunt, se tollunt?"

O

Atque

Atque eò stultitiæ et vecordiæ progressi sunt, ut NUMEN SUMMUM, passim, per vocem TO ΘΕΙΟΝ designarunt, cujus significatio communis apud Veteres, fuit "*Sulphur Sacrum*," Anglicè "*Lightning*."

Sic Lucas Casum Sodomi referens, xvii. 29. ex *Genesis*, xix. 24.

Εβρέξε πυρ και Θειον, (Κυριου) απ' ουρανυ.

"Depluit (DOMINUS) ignem et sulphur de cælo."

Et phrasin classicam, Θεις πληρο, exponit Hesychius, τῶ κεραυνῷ πυρος λεγει' οδμην γαρ εχει ο κεραυνος θεις,—"Ignem fulmineum vult; habet enim fulmen sulphuris odorem." Appellatur autem Θειον—το εκ Θεις αφιγμενον, utpote "ex Deo proventum."

192. Notatu dignissimum est quòd unico tantum Evangelii loco, usurpatur TO ΘΕΙΟΝ in sensu philosophico, pro DIVINITATE seu NUMINE SUMMO, idque à Paulo, hallucinationem Stoicorum atque Epicureorum Athenis perstringente:—

"Minimè reputare debemus, auro vel argento, vel lapidi, sculpturæ nimirum artis solertiae que humane (TO ΘΕΙΟΝ) DIVINITATEM esse similem."—*Act.* xvii. 29.

Omnibus aliis in locis vox Θειον in sensu communi adhibetur, pro sulphure sacro.

193. Quanto acumine refellit Paulus dogmata Aristotelica de motu necessario, seu mechanico:—

Τις η της κινησεως αρχη τη ψυχη; δηλον δε ωσπερ εν τω ολω ΘΕΟΣ, και παν εκεινω. Κινει γαρ πως τα παντα το εν ημιν ΘΕΙΟΝ.—'Εν τι των αδυνατων το υπαρχειν ψυχη κινησιν.

"Quid est principium motus animo? Patet sanè, sicut in toto DEUS, ita quoque Omne in Illo: *Movet* enim quodammodo omnia in nobis DIVINITAS."—"Ex impossibilibus unum est quoddam, animo competere motum."

Contrà asserit Apostolus, motum hominum voluntarium, et tamèn à DEO oriundum:—Εν ΑΤΤΩ (ΘΕΩ) γαρ ζωμεν και κινεμεθα και εσμεν—"In ILLO (DEO) enim vivimus et nosmet movemur et sumus."—Nam κινεμεθα vox media est.—Quà ratione autem nosmet sponte movemur, mortalibus scire non fas est; à DEO hæc facultas conceditur, sed more nobis prorsus incognito, et nunquam forsàn cognoscendo. Vide § 189.

194. Sufficiant hæc de *Æthere*, seu De Deo Sulphureo et Materiali Sophistarum Veterum, hoc nostro sæculo rationis (ut dicitur) infausto, eheu! renascentium. Annon poeta noster Ethicus quoque, Pope, inscius forsàn, in hunc turpissimum errorem

errorem *Stoicorum* et *Peripateticorum*, à *Cartesio* et *Leibnitzio* malè recoctum, lapsus esse videur, ubi *Deum* hallucinans *Animam Mundi* refinxerit?

“All are but *parts* of one stupendous *whole*,  
Whose *body* NATURE is, and God the *soul*.”

Quanto meliùs fuisset, si à disquisitionibus spinosissimis et *periculosa* plenis *aleæ*, quæ poëtis (qui plerumque in hisce studiis severioribus parùm sunt versati) minimè conveniunt, prorsùs abstinuisset, dogmatis illius fani à se-ipso alibi prolati ritè memor!

“A little learning is a dangerous thing;  
Drink deep, or taste not the *PIERIAN SPRING*.”

Vide § 207.

195. Regerent hìc forsàn Poetæ, *Populi*que fautores, “nōne ipse *Newtonus* paritèr quoque peccat, ubi de *Sensorio DEI* differit in sublimi argumento de existentia *ENTIS SUPREMI* ex operibus *Naturæ* causisq̃ue finalibus patefacti?” *Optics*, p. 345.

“Does it not appear from *phænomena* that there is a *BEING incorporeal, living, intelligent, omnipresent*, who in infinite space (as it were in *his Sensory*) sees the *things themselves* intimately, and thoroughly perceives them, and comprehends them wholly by their immediate presence to *HIMSELF*: of which things the *images* only, carried through the organs of sense into our *little sensoriums*, are there seen and beheld by *that* which in us perceives and thinks?”

But how cautiously, how correctly does *Newton* guard against misrepresentation of his meaning, in a subsequent passage, p. 379.

“Such a wonderful *uniformity* in the *planetary system*—the *uniformity* in the bodies of *animals*—the *first contrivance* of these very artificial parts—the eyes, ears, brain, muscles, &c. and other organs of sense and motion; and the *instinct* of brutes and insects, can be the *effect* of nothing else than the *wisdom* and *skill* of a *Powerful, Everliving AGENT*; who, being in all places, is more able by *his will* to move the bodies within his boundless uniform *sensorium*, and thereby to form and reform the parts of the Universe, than we are by *our will* to move the parts of our own bodies.

“And yet, we are not to consider “*the World* as the *body* of God, or the several parts thereof as the *soul* of God:”—*HE* is an *UNIFORM BEING*, void of organs, members or parts; and *They* are his *creatures*, subordinate to *HIM*, and subservient to *his will*: and *HE* is no more *the soul* of *them*, than the *soul* of *man* is the soul of the *species* of things carried through the organs of sense into the place of it's sensorium; where *It* perceives them by means of it's immediate presence, without the intervention of any *third* thing.

[N. B.] "The *Organs of Sense* are not for *enabling the soul to perceive the species of things in it's sensorium*; but only for *conveying them thither*: and God has no need of such organs; He being every where present to the things themselves."

---

## DE ENTE SUPREMO.

---

196. AUDIAMUS *Newtonum* quoque, tunc temporis grandævum, gravissimè et ornatissimè de hoc mysterio maximè incomprehensibili differentem, in *Scholio generali Principiorum*, nunquàm satis laudando.

"Hic omnia regit, non ut *Anima Mundi*, sed ut *Univerforum Dominus*. Et propter dominium suum Παῦτοκρατωρ (id est, *Imperator Universalis*), dici solet: Nam *Deus* est vox relativa, et ad *servos* refertur; et *Deitas* est *Dominatio Dei*, non in corpus proprium, (ut sentiunt quibus *Deus* est *anima mundi*), sed in *servos*.—Vox *Deus* passim significat *Dominum* (m). *Dominatio* ENTIS SPIRITUALIS, DEUM constituit, vera verum, summa summum, ficta fictum. Et ex *dominatione*

---

### DE NOMINIBUS DEI PRIMITIVIS.

(m) *Newtonus*, "*Pocock* nostrum secutus, vocem Latinam *Dei* deducit à voce Arabicâ *Du*, (et in obliquo casu, *Di*), quæ *Dominum* significat,"—At minùs rectè, ut videtur. Et fortàn, haud importunum erit, pro munere meo *professorio*, quamvis *emerito*, de sacrosanctis DEI nominibus primitivis, cautè, verecundè et circumspèctè ex rationibus *etymologicis*, sanioribus magisque scientificis, forsan, quam hæcenus per *Lexica* quævis *Orientalia* vel *Institutiones Hebræas* prolatis, breviter differere.

#### ‘ΑΓΙΑΣΘΗΤΩ ΤΟ ΟΝΟΜΑ ΣΟΥ.

"*Sanctificetur Nomen Tuum.*"

Innuît *Pocock*, nimio Arabisni studio illectus, Linguam Arabicam esse *primævam*.—Cæterùm omnium matrem esse *Hebræam*, satis constabit ex nominibus propriis, *Vitorum*, *Regionum*, *Fluviorum* et *Urbium*, tam antè diluvium quàm per quinque generationes post; quæ omnia sunt purè *Hebræa*, et plurima ex cæteris dialectis primitivis exulant. Et necessariò, quidèm, si Lingua *Noachidarum* erat eadem ac *Antediluvianorum*; et si "*Totus Mundus fuit unius linguæ uniùsque dialecti*" usque ad *Dispersionem Babelitan* et *Linguarum Confusionem*. Gen. xi. 1.

Vox Latina *Deus* rectiùs deduci potest immediatè à Græcâ Δεὺς, Doricè pro Zeus, —(*Hesych.*)—transmutatione literarum *cognatarum* per omnes gentes usitatissimâ; atque hæc iterùm à voce Phœniciâ Ieuw, qualem pronunciabant nomen *Dei* tetragrammatum apud *Hebræos* sanctissimum, יהוה, Iehōb; (*Scaliger*, ex *Sanchoniathone*, De *Emend. Temp. Fragm.* Not. p. 37.) simili transmutatione, et pro terminatione Hebræâ מ, ōh, substituendo quòque terminationem Σ, à Lingua *Medæ*, seu *Persicâ* primitivâ, mutuata; (*Herodotus*, I.) Antiquitùs autèm, ab Oraculo *Clarii Apollinis*, pronunciabatur Iaw, quasi Iehōb, sciscitantibus "*quis Decrum habendus sit qui vocatur Iaw?*" (*Macrob.* I. 18.)—Undè *Priscorum Græcorum* Ζας et Ζαυ—Zavos, et Ionicè Ζη—Zyvos—(*Hesych.*) et

*dominatione verâ sequitur DEUM VERUM esse vivum, intelligentem et potentem : ex reliquis perfectionibus summum esse vel summè perfectum.*

“Deus est UNUS ET IDEM DEUS, *semper et ubique. Omniprensens* est, non per *virtutem* solam, sed etiâ per *substantiam* : nam virtus sine substantiâ subsistere non potest. In Ipso *continentur* et *moventur* Univerſa, sed sine mutuâ passione : Deus nihil patitur ex *corporum motibus* ; illa nullam sentiunt resistentiam ex *Omnipræsentia* DEI.

“Deum

Præcorum Itatorum, *Ianus*, Deorum antiquissimus, qui “*Saliorum* quôque antiquissimis carminibus *Deorum Deus* canitur.” *Macrob.*

Hanc vocem *Iaw* contraſtius pronunciabatur *Iw*, quam malè confundunt omnes ferè editores Græci atque Latini, cum interjectione O! ut *Euripid. Bacchæ*, 583.

*Iw, Iw, Δεσποτα, Δεσποτα.*

“*Io, Io, Domine, Domine.*”

—pro *Iw Baxxe*, “*Io Bacche*,” *Hor. Sat. l. 3. 7.*

Itémque *Virgilius*, archaismi observantissimus, *Æn. 10. 17.*

“*Io-pater, Io—Hominum Divûmque æterna potestas.*”

—quæ vulgò *Jupiter*, pronunciatur, at in casibus obliquis, *Io-vi*, *Io-vi*, &c. verum suum etymon declarat. Vocem *Iw* interpretatur *Hesychius*, *εἷς, uno* ; et confirmatur ex *Homeri* Ionicâ, in phrasi *Iw ἡμῶν*, *Iliad. 6. 422.* interpretante Scholiâ, *ἐν μιᾷ ἡμέρᾳ*, “*uno die.*” Optimè autem consentit *Sacra Scriptura*, *Deut. vi. 4.* et *Mark xii. 29.*

“*Audi Israel, Dominus Deus noster Dominus unus est.*”

Et notatū dignissimum est quod nunquàm ab Hebræis *יהוה*, *Iaw*, nunquàm à Græcis, *Ζεὺς* aut *Zeus*, pluralitèr usurpantur, utpote *unitatem Dei* designantes.

‘*Εἰς Ζεὺς, εἰς Ἀδης, εἰς Ἥλιος, εἰς Διόνυσος.*

“*Unus Jovis, unus Pluto, unus Sol, unus Bacchus.*”

Ut refert *Orpheus*, citante *Macrobio*, qui cum *Oraculo Clario* consentit.

Et vox ipsa *יהוה* ultimò deduci videtur à radice primævâ *יה* *Iab*; quæ nomen Dei antiquissimum apud Hebræos fuit, (sicut apud Italos, *Iannus*) ; et cuius propria significatio optimè forsàn ab *Homero* asſervatur in phrasi *Ια γηγυς*, *Iliad. 4. 437.* interpretante Scholio, *μία καὶ αὐτὴ φωνή*, “*una eadèmq̃ lingua.*”—Et optimè respondet hæc significatio, *Isa. xxvi. 4.* ubi *יה* et *יהוה* simul occurrunt :

“*Fidite Domino usque in perpetuum,*

*Quia in (Iab, Iabob) uno eodèmq̃ Domino est Petra Sæculorum.*”

Egregiè igitur designat radix *יה* Divinam immutabilitatem et æternitatem. Confer *Malach. iii. 6.* *Jam. i. 17.* *John xiv. 1.* *Heb. xiii. 8.*

2. A voce Hebræâ, *די* *Di*, quæ propriè significat *Sufficiëntiam*, *Copiam*, *Opes*, et undè epitheton divinum *יהוה Sadi*,—“*cujus est sufficiëntia,*” *Gen. xvii. 1.* et *2 Cor. iii. 5.* quasi ab radice exsurgunt Arabicâ, *Sadi* ; Græca *Δις*, *Δι-ος*, quæ *Deum Summum* designabat ; cum voce *Zeus* synonymans, et sibi postea casus obliquos *Δι-ος*, *Δι-ι*, *Δι-α*, assumens ; et Latina *Dis*, *Di-tis*, Deum Infernum, *Plutonium*, turpiore Theologiæ Primitivæ depravatione ; et indè quoque, *Dii Manes*, seu *Dæmones*, mortuorum umbræ, quas pravissimâ superstitione colebant gentes.—Hinc *Jupiter* appellatur *Dis-piter* ab *Horatio*, distinctionis gratiâ, non *Diespiter*, ut imperitè editores.

3. A voce Hebræâ *יהוה Elōb*, quæ propriè *ὁ Δυνατός* vel *Δεσποτικός*, “*Dominus*,” vel “*Imperator*” significat, *1 Tim. vi. 15.* vel *Jude iv.* Atque DEO SUMMO antiquitûs à gentibus omnibus tributa

“Deum Summum *necessariò existere*, in confesso est. Et eàdem necessitate *semper* est et ubique. Unde etià totus est *sui-similis*: Totus oculus, totus auris, totus cerebrum, totus brachium, totus vis sentiendi, intelligendi et agendi; sed more minimè humano, *more nobis prorsus incognito*. Ut cæcus non habet ideam colorum, sic nos ideam non habemus modorum quibus Deus *Sapientissimus* fenit et intelligit omnia.

“*Corpore omni et figurâ corporeâ* prorsus destituitur; ideòque videri non potest, nec tangi, nec sub specie rei alicujus corporeæ coli debet. Ideas habemus *attributorum* ejus, sed quid sit alicujus rei *substantia* minimè cognoscimus. Videmus tantùm corporum figuras et colores, audimus tantùm sonos, tangimus tantùm superficies externas, olfacimus odores solos, et gustamus sapes; intimas substantias nullo sensu, nullâ actione reflexâ cognoscimus; et multò minus ideam habemus substantiæ Dei.

“Hunc cognoscimus solummodò per *proprietates* ejus et *attributa*, et per *sapientissimas* et *optimas* rerum *structuras*, et *causas finales*; et *admiramur* ob perfec-

tributa est, ritè deducitur variabilis *Allab, UHab* vel *Alo*, quæ vel hodiè cunctas ferè regiones Orientales peragravit; atque ipsa *אלֹהִים* *Æloh*, pari analogiâ, ex nomine Dei longè antiquissimo omnium, *אֱלִי* *Æli*, facillè derivatur; quæ abstractè significat *ἡ δύναμις*, “*Potentia*,” concretè verò, *ὁ δυνατός*, “*Potens*.”—Et notio Dei primaria et omnium simplicissima et usitatissima erat *Potentia*, sive beneficiæ sive maleficiæ. Vid. *Gen. xxxi. 29.* ubi minuitur *Laban Jacobo* genero suo profugo—“*Est potentia manus meæ te nocere*,”—*לֹא*. Vide quoque *1 Sam. xvii. 26.* et *2 Kings, v. 7.* et *Rom. i. 20.* ubi *Paulus* pro parallelis recenset Dei *ΣΥΜΜΗ ΔΥΝΑΜΙΣ καὶ ΘΕΙΟΤΗΣ*, “*Potentia et Deitas*,”—quem probè sequitur *Newtonus*—“*Deitas est Dominatio*.”

4. Gliffante verò Idololatriâ, malè haberi incæpit vox *אֱלִי* *Æli*, pro *Sole*, numinibûsque fictis *Mythologiæ Veterum*; unde *Solis* epitheton, *Αελ-ιος*, *Ηλ-ιος*, vel *Ἡλ-ιος*, in diversis Græciæ (in *Theologiâ mendacissimæ*) dialectis. Sic plorat *Phæibon*, fulmine ictus. *Euripid.*

Ω γρυσοφειγγες Ἡλι, ὡς μ' ἀπώλεσας;  
Ὅθεν Σ' Ἀπελλων ἐμφανως κλησῇ βροτός.

“O aureâ tædâ prædite *Sol*, quomodo me perdidisti!  
Undè Te *Perdentem* clarè vocant mortales.”

Atque inde pluralitèr usurpari cæperunt *אֱלִים* et *אֱלֹהִים* *Ælim* et *Ælobim*, pro *Angelis, Divis, Judicibus, Heroibus, &c.*—Unde ad retinendam præstantiam Dei *ΣΥΜΜΗ*, cum epithetis variis usi sunt Hebræi Prophetæ, *אֱלִי אֱלִים*, *Æli Ælim*, *Dan. xi. 36.* “*Deus Divorum*,”—*אֱלֹהִים אֱלִים*, *Æli Ælobim*, “*Deus Divorum*,”—*אֱלֹהִים יְהוָה*, *Iaboh Ælobim*, “*Dominus Divorum*,”—et *יְהוָה אֱלֹהִים אֱלִים* *Æli Ælobim Iaboh*, sicut plenissimè describitur Nomen Dei sacrosanctum, *Jesb. xxii. 22.* *Pf. l. 1.* “*Dominus Deus Divorum*.”

5. Atque hinc, ellipsi frequentissimâ *אֱלֹהִים* *Ælobim*, licet vox pluralis, usurpatur singularitèr: ut *Gen. i. 1.* *אֱלֹהִים* *D. us creavit*; subaudito vel *אֱלֹהִים* *Iaboh*, vel *אֱלִי* *Æli*, vel utroque. Atque hoc pacto Scripturis Hebræis grammaticè amovetur *solæcismus* iste, qui mirè torsit interpretes, atque varia absurda, imò impia, commenta, *Rabbinorum* et *Myficorum* peperit; ut videre licet in *Lexicis* Scriptisq; *Kimebi, Buxitf, Parklurf, &c. &c. &c.*

6. Ex his igitur nominibus Dei sacrosanctis, omnium vetustissimis atque maximè radicalibus, *אֱלִי* *Æli*, et *יְהוָה* *Iab*, utpote simplicissimis, (unde deducuntur Dei nomina propria in omnibus Linguis primitivis, necnon in dialectis, tam Orientalibus quàm Occidentalibus;) vel ex his solis non inficiantur *Etymologi* æqui et periti, omnium matrem, ipsamque primævam linguam, fuisse *Hebræam*. Sed hæc paucis exponi non possunt.

tiones;

*hōnes*; veneramur autem et *colimus* ob *dominium*: colimus enim ut servi, et DEUS sine *dominio*, *providentiā* et *causis finalibus*, nihil aliud est quam *Fatum* et *Natura*: à cæcā *Necessitate Metaphysicā*, quæ utique eadem est semper et ubique, nulla oritur *rerum variatio*: tota rerum conditarum *diversitas* ab *ideis* ex *voluntate* ENTIS NECESSARIÒ EXISTENTIS solummodò oriri potuit.

“Dicitur autem DEUS per allegoriam, *videre, audire, loqui, ridere, amare, odio habere, cupere, dare, accipere, gaudere, irasci, pugnare, fabricare, condere, construere*: nam sermo omnis de Deo, à *rebus humanis* per similitudinem aliquam desumitur, non perfectam quidem, sed *aliqualem* tamen.

“Et hæc de DEO; de quo utique ex *phænominis* differere ad PHILOSOPHIAM NATURALEM pertinet.”

197. In hoc *Scholio generali* summè *Theologico*, obijciunt *Metaphysici Leibnitiani*, Newtonum denegare existentiam *spatii* et *durationis* absolutam, ubi affert, p. 528:

“DEUS non est *æternitas* et *infinitas*, sed *æternus* et *infinitus*; non est *duratio* et *spatium*, sed *durat* et *adeſt*: *durat semper* et *adeſt ubique*; et *existendo semper et ubique, durationem et spatium, [æternitatem et infinitatem] constituit*.”

198. Cæterum responsio facilis: Si non existeret DEUS, quo pacto *spatium* et *duratio* ab ullo *Ente intelligente* cernerentur? Nam, ut ipsi loquuntur *Metaphysici, de non apparentibus et de non existentibus eadem est ratio*.—Newtono adſtipulatur sublimis illa *Theologia Patriarcharum et Evangelistarum*: docuit enim *Orpheus*; *Mosem* secutus, quod “*Deus est Lux—Lucem habitans inaccessibilem*,” et confirmat *Paulus*, in celeberrimā illā DEI SUMMI descriptione, omni laude longè longissimèque majore, quam potissimum secutus atque interpretatus est *Newtonus*: 1 *Tim.* vi. 15.

‘Ο ΜΑΚΑΡΙΟΣ ΚΑΙ ΜΟΝΟΣ ΔΥΝΑΣΤΗΣ,  
‘Ο ΒΑΣΙΛΕΥΣ ΤΩΝ ΒΑΣΙΛΕΥΟΝΤΩΝ,  
ΚΑΙ ΚΥΡΙΟΣ ΤΩΝ ΚΥΡΙΟΝΤΩΝ.

‘Ο μόνος εχων ἀθανασίαν.

Φως οἰκῶν ἀπροσῆκον.

‘Οὐ εἶδεν ὁδὸς ἀνθρώπων, ὅδε ἰδεῖν δύναται.

‘Ω ΤΙΜΗ ΚΑΙ ΚΡΑΤΟΣ ΑἰΩΝΙΟΝ. ΑΜΗΝ.

“FELIX ATQUE SOLUS IMPERATOR,  
REX REGENTIUM ET DOMINUS DOMINANTIUM;  
*Solus habens immortalitatem,*  
*Lucem habitans inaccessibilem,*  
*Quem vidit nemo mortalium, nec videre potest:*  
CUI HONOS ET DOMINIUM ÆTERNUM. AMEN.”

199. Confirmat quoque *Johannes*:

‘Ο ΘΕΟΣ Φως ἐστὶ, καὶ Σκότης ἐν Αὐτῷ οὐκ ἐστὶν ὁδεμία.

“*Deus Lux* est, atque in Illo haudquaquàm est *caligo*.”

Πνεῦμα ‘Ο ΘΕΟΣ—‘Ο ΘΕΟΣ Ἀγάπη ἐστὶ.

“*Spiritus, Deus*”—“*Deus est Charitas*.”

At si prædicantur *Lux, Spiritus, Charitas*, de Deo *abstractè*, ut loquuntur Logici, non concretè, nōne pari analogiâ in re prorsùs incognitâ, “*constituat* quoque *duraticnem et spatium*?”

200. Ingenti *veræ Theologiæ* detrimento fines *Philosophiæ Naturalis* (cujus est “*fidelitèr Theologiæ ancillari*,” ut optimè *Bacon*), temerè transgrediuntur Metaphysici; ubi malè sani profiteri audent “*Dei existentiam et attributa demonstrari à priori*,”—ut infaustâ diligentîâ, Doctus *Clarke*, speculationibus metaphysicis ex controversiâ *Leibnitziand* nascentibus, nimis imbutus, et iisdem periculose indulgens. Deum enim *necessariò existere*, certissimum est: sed talis existentîæ idea, utcunque per se positiva, nostro conceptui est planè *negativa*; solummodò indicans “*nullam causam*” ejus dari extrinsecùs: cæterùm *idea negativæ scientiam positivam minimè pariunt*, ipso testante *Locke, Essay, &c.* IV. 1. 5.

201. *Existentia Dei* intellectum omnium creaturarum ratione præditarum transcendit, imò *Angelorum et Archangelorum*, præter “*FILIUM CHARITATIS EJUS*,”—JESUM CHRISTUM DOMINUM NOSTRUM:—qui “*Illi proximos occupavit bonos*”—*Hor.* ut ex myſtagogo maximo, *Johanne*, discimus, *Rev. xix. 16.*

ΒΑΣΙΛΕΥΣ ΒΑΣΙΛΕΩΝ  
ΚΑΙ ΚΥΡΙΟΣ ΚΥΡΙΩΝ.

“*REX REGUM ET DOMINUS DOMINORUM*.” (n)

Cui

---

(n) Quàm accuratè distinguunt Myſtagogi omnium maximi, *Paulus* et *Johannes*, inter Θεον τον Πατέρα, “*Deum Patrem*,” atque Τον τον Μονογενη, “*Filium unicum Genuinum, seu Dilectum*,” *John*, i. 16. *Paulus* enim PATREM designat titulo plenissimo maximèque augusto, ὁ Βασιλεὺς των Βασιλευόντων, καὶ Κυριὸς των Κυριόντων, quem haudquaquàm assequitur exilitas Linguae Latinae, articulo *emphatico*, ὁ, carentis; sed qui *Anglicè* efferri potest—“*THE KING OF THE REIGNING [Kings], AND LORD OF THE RULING [Lords]*.”—*Johannes* verò FILIUM, titulo planè proximo: Βασιλεὺς Βασιλεων, καὶ Κυριὸς Κυριων—“*KING OF KINGS, AND LORD OF LORDS*,”—uno eodemque SPIRITU DIVINO ambo afflati.

Nec

Cui inditum est Dei gratiâ, Ονομα το ὑπερ πάντων ονομα, "*Nomen suprâ omne nomen*" (vel auctoritatem) tûm in *Cælis*, tûm in *Terris*, tûm in *Infernis*, —εις δοξαν ΘΕΟΥ ΠΑΤΡΟΣ, "*in laudem DEI PATRIS*;" nunc, sub *novo fœdere*, *Phil.* ii. 9; sicut olim, sub *primo fœdere*, *Exod.* xxiii. 21.—Nam asserit ipse 'Ο ΛΟΓΟΣ ΤΟΥ ΘΕΟΥ, "*Oraculum Dei*:" *Matt.* xi. 27.

Πάντα ΜΟΙ παρεδόθη ὑπο ΤΟΥ ΠΑΤΡΟΣ,  
Και ὅδεις ἐπιγινώσκει ΤΟΝ 'ΤΙΟΝ, εἰ μὴ 'Ο ΠΑΤΗΡ.  
Οὐδε ΤΟΝ ΠΑΤΕΡΑ τις ἐπιγινώσκει, εἰ μὴ 'Ο 'ΤΙΟΣ,  
ΚΑΙ ὃ ἐὰν βεληται 'Ο 'ΤΙΟΣ ἀποκαλύψαι.

"*Omnia MIHI commissa sunt a PATRE*;  
*Et nemo intimè cognoscit FILIUM, nisi PATER*;  
*Neque PATREM quis intimè cognoscit, nisi FILIUS,*  
*Et cuicumque voluerit FILIUS revelare."*

*Nec Ethnicis latuit hæc distinctio: Audi Horatium.*

"*Quid prius dicam solitis PARENTIS*  
*Laudibus, qui res Hominum ac Deorum,*  
*Qui Mare et Terras, variisque Mundum*  
*Temperat boris?*  
*Unde nil majus generatur IPSO:*  
*Nec viget quicquam simile aut secundum.*  
*Proximos ILLI tamen occupavit*  
*PALLAS honores."*

Hæc certè ex *Theologiæ primæ* reliquiis extraxit *Horatius*.—"PARENS" enim est ὁ Πατήρ Ἀνδρῶν τε Θεῶν τε, *Orphei*, *Homeri* et *Hesiodi*, licet quid hæc appellatione maximè honorificè verè significaretur parùm callebant: PALLAS verò, gentium *Dea Billatrix*, à Παλλῶ, "*vibro*," [*fulmen, telum, &c.*] derivatur; hæc enim vox *epitheton* tantùm designat—Παλλὰς Ἀθηνῆν, ut *Homero* passim. Ejus autèm nomen Ἀθηνῆν ab *Egyptiacâ Ντῖθ*, seu SAPIENTIA, retrò legendo derivatur; ut *Nst.* (p) monuimus: quæ eadem primitus fuit cum דַּבָּר דְּיָהוָה, *Dabar Iahob* Testamenti Veteris, *Gn.* xv. 1. seu Novi—"Ο ΛΟΓΟΣ ΤΟΥ ΘΕΟΥ, "*Oraculum Dei*," *Rev.* xix. 13.—ΕΚΕΙΝΟΣ ἐξηγήσατο—"ILLE exposuit."—*Jobn.* i. 18.

Notatu dignissimum est quòd, referente *Horatio*, PALLAS, non *arripuit*, non *arrogavit* sibi, sed DEI gratiâ, "*Proximos ILLI occupavit honores*,"—*occupavit*, quasi *jure hæreditario*; sicut optimè exponit *Paulus*, de JESU CHRISTO—"Ὁς ἐν μορφῇ Θεοῦ ὑπαρχὼν, ἐκ ἀρπαγμῶν ἡγήσατο τὸ εἶναι Ἰσα-θεῶν· ἀλλ' ἑαυτὸν ἐκένωσε, &c."—"Qui in *firmâ divinâ* [licet] subliſtens, non *instar prædæ* duxit *ſieri Deo ſimilem*; sed se-ipsam *exhaustit*," &c.—*Phil.* ii. 7.

Fabulantur *Mythologi Ethnici*, DEAM SAPIENTIAM panopliâ instructam ἐκ Διὸς κεφαλῆς, "*è Jovis capite*" emicuisse, plenè adultam, non infantem; temerè confundentes, ut videtur, vocem *Hebræam* ראש *Raôb*, ambigüe significantem tûm *caput* tûm *principium*, in sublimi illâ descriptione ortus *Sapientiæ primæ*, *Prov.* viii. 22.

"DOMINUS genuit ME, *principium viæ suæ*,  
Ante opera sua, primitus:  
Ab æternitate ordinatus sum, à capite,  
A primordiis Teræ."

Ubi phrasis *Hebræa* linæ penultimæ, מֵרָאשׁ *Meraôb*, quæ ad literam redditur, "*à capite*," seu "*ex capite*," æquipollet phrasi linæ primæ, דְּרֹאשׁ *Raôb derebu*—"principium viæ suæ;"—quam optimè interpretatur *Johannes*, *Rev.* iii. 14.—"Ἡ ἀρχὴ τῆς κτίσεως Θεοῦ," "*Primordium creationis Dei*," seu *πρωτολόκος πάσης κτίσεως*, "*Primogenitus omnis creationis*," *Col.* ff. i. 15.—De JESU CHRISTO. Et pari ambiguitate, phrasim *Orphei*, Ζεὺς κεφαλῇ, mutat *Plutarchus* in Ζεὺς ἀρχῇ. *Not.* (g).
